**Issued on the occasion of 61<sup>st</sup> All India Wheat & Barley Research Workers' Meet organized at RVSKVV, Gwalior during August 29-31, 2022.**

## **ACKNOWLEDGEMENT**

*The Resource Management Group of the ICAR-Indian Institute of Wheat and Barley*

*Research expresses sincere thanks to;*

- *The Director, ICAR-IIWBR, Karnal, Dr Gyanendra Pratap Singh for providing the facilities and support for smooth execution of the Resource Management programme.*
- *The scientists of the cooperating centres for successful implementation of the Resource Management programme.*
- *The technical staff of the Resource Management Programme Sh Madan Lal and Sh PHP Verma for help in successful execution of the Resource Management programme.*
- *The administrative, finance and farm services of the Indian Institute of Wheat and Barley Research for their cooperation and support to the Resource Management Programme.*

*The authors are also thankful to all those who might have helped directly or indirectly in effective execution of the programme.*

*S.C. Tripathi*

## **SUMMARY**

Food and nutrition security of the country is primarily reliant on natural resources, climatic conditions and agriculture produce. Despite shrinking land and water resources, climate abrasions and little genetic gain, India harvested 106.41 million tonnes of wheat during 2021-22. This was possible by adoption of latest high yielding diseases resistant varieties and their production technologies by Indian farmers. The imbalanced fertilisation and intensive tillage are still matters of concern leading to the degradation of natural resources. The multiple nutrient deficiencies are being reported from various parts of the Indo-Gangetic plains, the food basket of the country which is a result continuous mining of the soil coupled with imbalanced fertilisation. Nitrogen is generally applied in excess in NWPZ and in NEPZ it is applied less than the recommended ones and potash and micronutrients are rarely applied. The situation is further worsened by crop residues burning, which besides causing losses of precious organic source and essential nutrients also leads to environmental pollution causing health hazards. In order to provide food security and reverse the trend in natural resource degradation, technological advancements including developing better varieties suited to different cropping systems and growing conditions in various agro-ecological zones is a must. The higher agricultural productivity has to be achieved along with the improvement or at least without further detrimental effect to the environment and natural resources for long-term sustainability. Research efforts are focussed, in addition to varietal improvement, on the refinement of the technologies, diversification/intensification by including leguminous crops, integrated nutrient and weed management, to make food production cost and input efficient in order to increase the profit margins to the farmers.

The Resource Management group of the “All India Co-ordinated Wheat and Barley Improvement Project” (AICW&BIP), in addition to evaluating the performance of newly developed genotypes, is also actively engaged in developing and fine tuning the farmers’ and eco-friendly, location specific and cost effective technologies for higher productivity and profitability. The work on cost effective technologies is being executed through special trials depending on the priorities of various wheat growing zones. The results of the multi-location varietal evaluation and special co-ordinated trials are summarised hereunder.

In five wheat growing zones, twelve varietal evaluation trial series were conducted at a number of locations under different growing conditions. The newly developed genotypes were evaluated against the existing varieties used as checks. In addition, twelve special coordinated trials were also proposed to address the zone-wise problems and priorities.

The zone-wise details of the varietal evaluation trials conducted are given in Table 1. In all, 85 trials were proposed, of which 83 were conducted. Out of the conducted trials, twenty two trials were rejected due to low yield and/or high CV and improper data reporting. The overall conduct of trial was 97.6 percent with a success and rejection rate of 74.1 percent and 25.9 percent, respectively.

In NHZ, out of 5 proposed trials, all the trials were successfully conducted. One trial at Khudwani in restricted irrigation was not considered for pooled analysis due to improper reporting. In NWPZ, out of 25 proposed trials, all the trials were successfully conducted. Two trials at Karnal and Pantnagar in timely sown condition, one trial at Karnal in restricted irrigation and five trials in early sown HYPT (BISA Ladowal, Delhi, Gurdaspur, Ludhiana and Pantnagar) were not considered for pooling due to low mean target yield. In NEPZ, out of 18 proposed trials, all the trials were successfully conducted. Five locations (Ayodhya, Kalyani, Kanpur, RPCAU Pusa, Sabour) in timely sown and two locations (Kanpur, RPCAU Pusa) in late sown were not considered for pooling due to low mean target yield. In CZ, out of 27 proposed trials, all the trials were successfully conducted. Two locations (Durgapura, Udaipur) in restricted

irrigation and one location (Powarkheda) in HYPT were not considered for pooling due to low mean target yield. In PZ, out of 10 proposed trials, 8 trial trials were successfully conducted and Washim centre did not conduct both allotted trials. Two locations (Dharwad, Pune) in timely sown and one location (Dharwad) in late sown were not considered for pooling due to low mean target yield. The centres where the trials were not conducted or where the trials were rejected have been listed in the Table 1.

The performance of 28 final year test entries under different trials is presented in Table 2. In NHZ one test entry VL 2041 was evacuated under restricted irrigation conditions but was inferior to the best check HS 562. In NWPZ, under IR-TS-DOS-TAS trial, two test genotypes namely PBW826 and HD3406 were tested against four check varieties DBW187, DBW222, HD2967 and HD3086. In terms of yield, the test entry PBW826 recorded significant superiorly over all other entries in timely sowing (60.30 q/ha) as well as on overall basis (53.94 q/ha) and the best check was DBW222. In RIR-TS-TAS trial, three test entries HI1653, HI1654 and HD3369 were tested and all were found inferior to the best check HUW838. In NHZ, NEPZ and CZ, none of the test entries showed either numerical or significant superiority over the best check varieties. In PZ, test entry HI8826(d) showed numerical superiority (4.51%) over best check variety MACS3949(d).

The details of the special trials conducted in different zones are presented in Table 3. In all, 113 trials were proposed, out of which 108 were conducted and the conduct percentage was

95.6. The maximum numbers of special trials were conducted in NWPZ (28) followed by CZ (28), NEPZ (24), PZ (21) and NHZ (07).

### **Northern Hill Zone**

In this zone, the performance of test genotype was evaluated under restricted irrigation conditions at different locations and results are summarized here under;

#### **Restricted Irrigation**

In NHZ, the performance of one test genotype VL 2041 was evaluated under restricted irrigation conditions (0,1 and 2 irrigation levels) against four checks [HPW 349(c), VL 907(c), HS 562(c), HF 507(c)] at five locations (Almora, Bajaura, Khudwani, Malan and Shimla). For pooled analysis, Khudwani centre data were not included due to incomplete data. The data presented in Fig. 1 showed that increasing irrigation levels significantly increased the grain yield. Maximum and significantly higher grain yield (41.16 q/ha) was obtained with two irrigations as compared with zero and one irrigation levels. All the check varieties were significantly superior to test entry VL 2041. Among check varieties, HS 562(C) produced significantly higher yield (40.48 q/ha) on mean basis. Irrigation level and genotypes interaction was non-significant for grain yield.

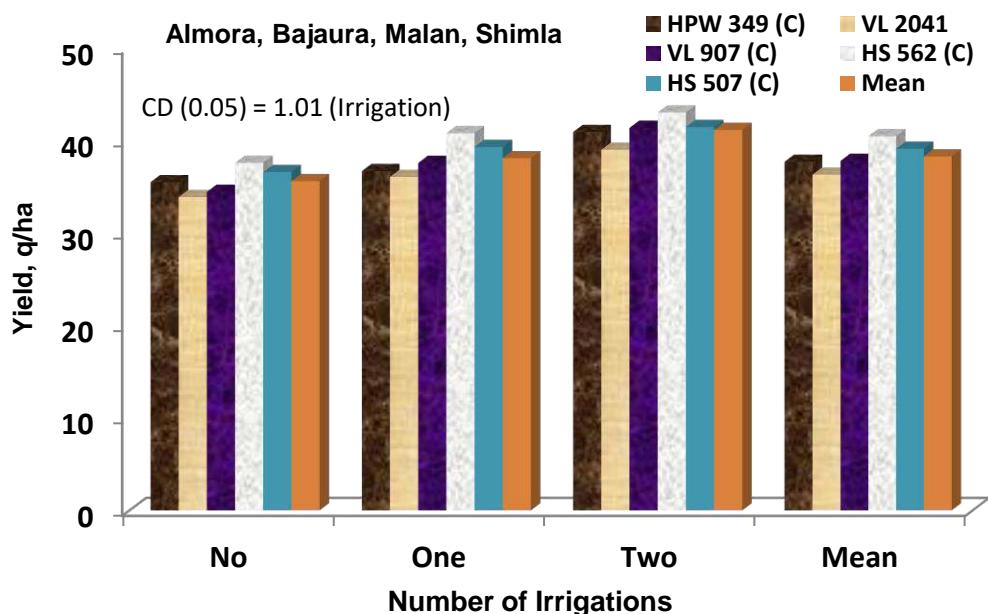

Fig. 1. Genotype performance under restricted irrigation conditions in NHZ

### **North Western Plains Zone**

The performance of test genotypes was evaluated under different sowing conditions, restricted irrigation conditions and at high fertility condition at different locations and the results are summarized here under;

### Irrigated Timely Sown

Two test entry, HD3406 and PBW826 were evaluated against four checks viz. HD2967(c), HD3086(c), DBW187(c) and DBW222(c) at nine locations (Delhi, Gurdaspur, Gwalior, Hisar, Jammu, Karnal, Ludhiana, Pantnagar and Sriganganagar) under Timely (5th November to 11th November) and late (10th December to 16th December) sown conditions. For pooled analysis, Karnal and Pantnagar data were not considered due to low mean target yield. Timely sowing gave higher productivity of all genotypes compared to late sowing and on an average, yield declined by 21.5% when sowing was delayed from timely to late sowing circumstances (Fig. 2). The test entry PBW826 was found the top yielder (53.94 q/ha) and recorded significantly higher yield compared to other test entry HD3406 and all the checks.

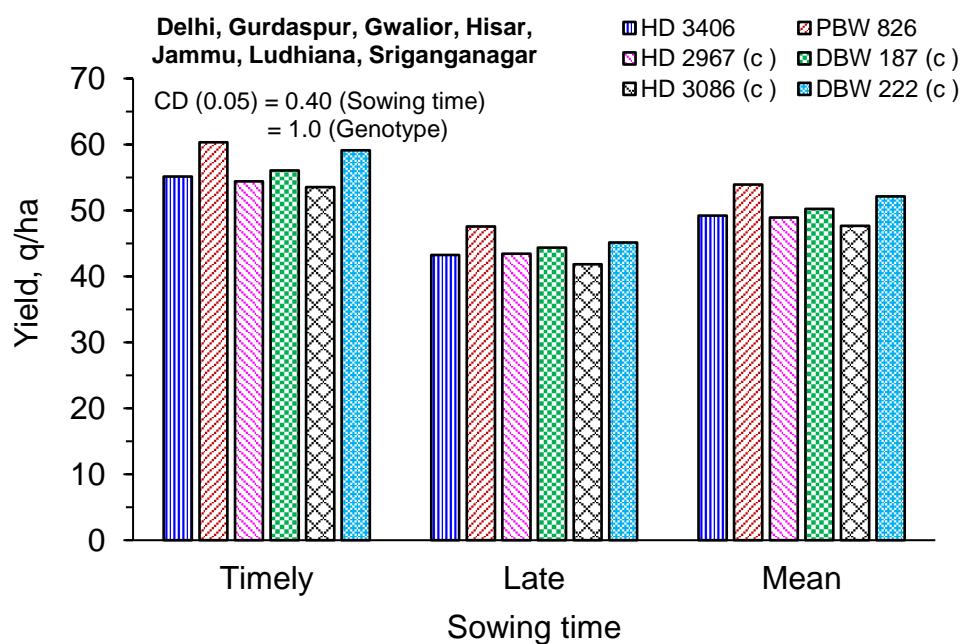

Fig. 2. Genotype performance under timely and late sown conditions in NWPZ

### Restricted Irrigation

The restricted irrigation trial was conducted with the objective to evaluate the three aestivum test entries namely HI1653, HI1654 and HD3369 against six checks [HD 3043(c), NIAW 3170(c), DBW 296(c), PBW 644(c), HI 1628 (c) and HUW 838(c)] at nine locations (Delhi, Gurdaspur, Gwalior, Hisar, Jammu, Karnal, Ludhiana, Pantnagar and Sriganganagar). For pooled analysis, Karnal centre data were not included due to low mean yield and rest eight centre data were pooled for statistical analysis. The results revealed that the check entry HUW 838(c) produced significantly higher mean grain yield (45.27 q/ha) as compared to all test entries and other checks except test entry HI1654 (44.65q/ha) which was at par (Fig. 3).

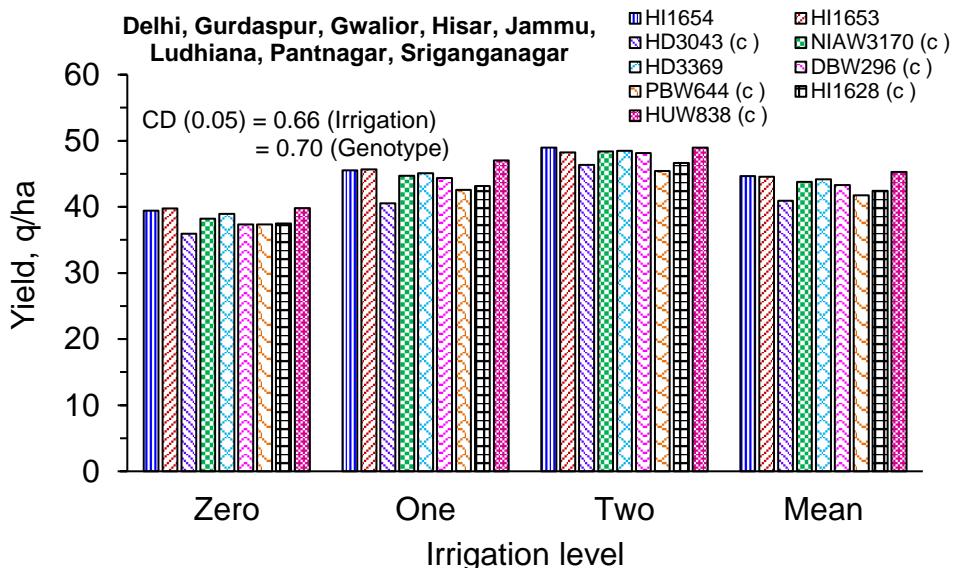

Fig. 3. Genotype performance under restricted irrigation conditions in NWPZ

### High Yield Potential Trial

This experiment was conducted at seven centres namely Delhi, Gurdaspur, Hisar, Karnal, Ludhiana, BISA Ladowal and Pan Nagar. For pooled analysis the data of Hisar and Karnal centres only were considered and rest five centre (Delhi, Gurdaspur, Ludhiana, BISA Ladowal and Pan Nagar) were rejected due to low mean yield (<65 q/ha) at highest fertility level. The pooled analysed data of two centres presented in Fig. 4 showed that grain yield enhanced significantly with increased fertiliser doses. Addition of 150% RDF and two sprays of growth retardants increased the grain yield (66.17 q/ha) significantly as compared to RDF (58.63 q/ha). This increase was to the tune of 12.9% over RDF. Genotype PBW872 ranked first on mean yield basis with yield of 67.73 q/ha, which was significantly higher than other genotypes. This genotype also yielded 70.85 q/ha under 150% RDF + 15 t FYM/ha + two sprays of growth regulators at first node and flag leaf stage which was higher than other varieties. High yield in PBW872 was due to its bolder grains (49.45g thousand grains weight). The second and third ranked high yielding genotypes were DBW371 (65.28 q/ha) and DBW327(c) (65.06 q/ha), respectively on mean yield basis.

### North Eastern Plains Zone

The performance of test genotypes was evaluated under different sowing conditions at different locations and the results are summarized here under;

#### Irrigated Timely Sown

Three test entries HD 3411, PBW 826 and HD 3406 were evaluated against five checks viz. HD 2967(c), HD 3086 (c), HD 3249 (c), HD 2733 (c) and DBW 187(c) at nine locations (Ayodhya, Coochbehar, Kalyani, Kanpur, Ranchi, RPCAU Pusa, Sabour, Shillongani and Varanasi) under timely (5th November to 11th November) and late (10th December to 16th December) sown conditions.

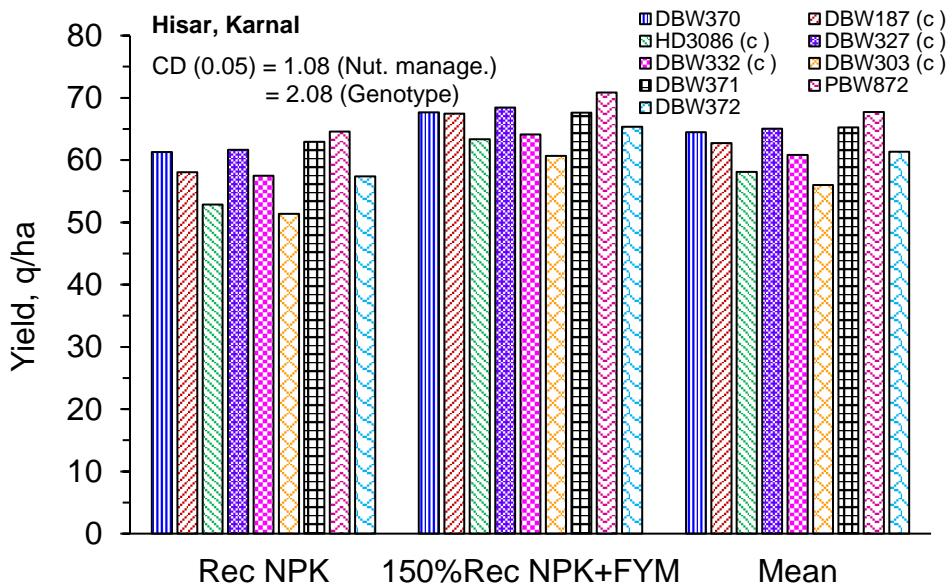

Fig. 4. Maximizing wheat productivity through fertilizer in NWPZ

The data of Ayodhya, Kalyani, Kanpur, RPCAU Pusa and Sabour were not considered for pooled analysis due to low mean yield (<45 q/ha under timely sown conditions). Timely sowing registered higher yield of all genotypes compared to late sowing and on mean basis, yield declined was 10.03% when sowing was delayed from timely to late sowing condition (Fig. 5). On mean basis, the check variety HD 2733 was the highest yielder ( $50.45 \text{ q ha}^{-1}$ ) and recorded significantly higher grain yield compared to all checks except DBW 187 and one test entry PBW 826.

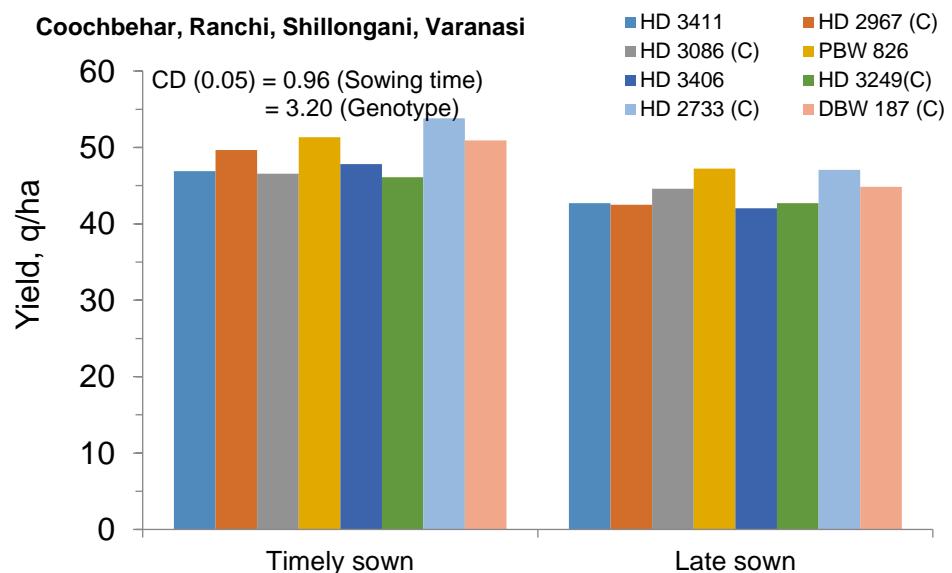

Fig. 5. Genotype performance under timely and late sown conditions in NEPZ

### Irrigated Late Sown

Three test entries DBW 316, PBW 833 and PBW 835 were evaluated against four checks viz. HI1563(c), HI1621 (c), HD3118 (c) and DBW 107(c) at nine locations (Ayodhya, Coochbehar,

Kalyani, Kanpur, Ranchi, RPCAU Pusa, Sabour, Shillongani and Varanasi) under late (10<sup>th</sup> December to 16<sup>th</sup> December) and very late (1<sup>st</sup> Jan. to 7<sup>th</sup> Jan.) sown conditions. The data of Kanpur and RPCAU Pusa were not considered in pooled analysis due to low mean target yield (<35 q/ha under late sown conditions). Late sowing registered higher yield of all genotypes compared to very late sowing and on mean basis, yield declined by 25.37% when sowing was delayed from late to very late sowing condition (Fig. 6). On mean basis, the test entry PBW 835 was the highest yielder (36.07 q ha<sup>-1</sup>) and was at par with all other test entries and checks.

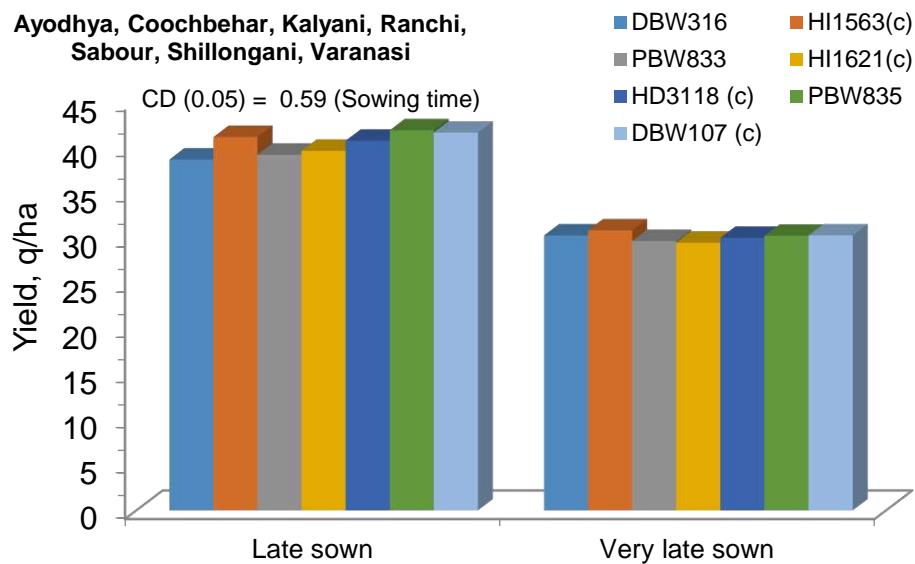

Fig. 6. Genotype performance under late and very late sown conditions in NEPZ

## CENTRAL ZONE

In this zone, the performance of test genotypes was evaluated under different sowing conditions and restricted irrigation conditions at different locations. High yield potential trial also conducted to maximize the wheat yield and the results are summarized here under:

### Irrigated Timely Sown

In irrigated timely sown conditions, three test entries (HI 1650, MACS 6768 and MP 3535) were evaluated against four check varieties (HI 1544, GW 322, GW 513 and HI 1636) at eight locations (Bilaspur, Durgapura, Indore, Jabalpur, Junagadh, Powarkheda, Udaipur, Vijapur) under timely (12th November to 18th November) and late (03rd December to 09th December) sown conditions. The results showed significant effect of sowing time and genotypes on yield (Fig. 7). Timely sowing gave significantly higher productivity of all genotypes compared to late sowing and on an average yield decline by 11.16% when sowing was delayed by 15 days.

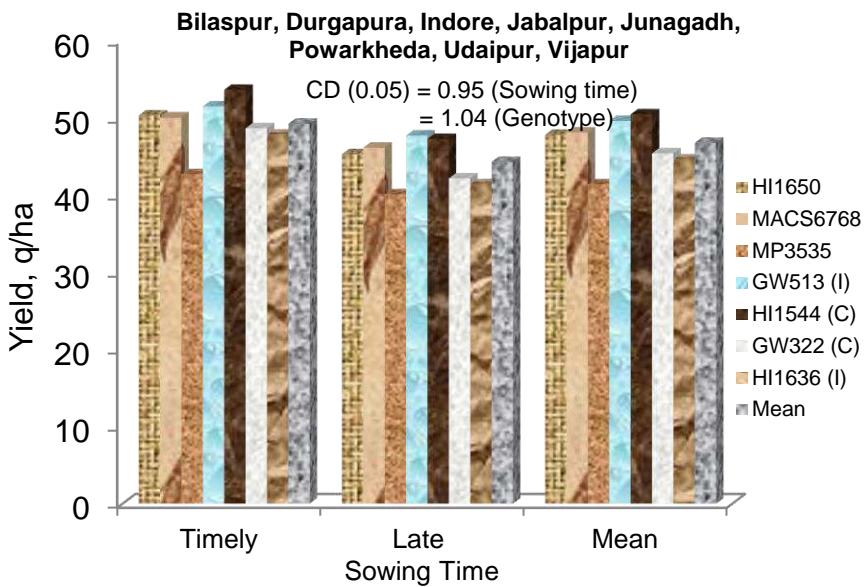

Fig. 7. Genotype performance under timely and late sown conditions in CZ

#### Irrigated Late Sown

In irrigated late sown condition, one test entry HD 3407 was evaluated against five check varieties (HD2932, HI1634, MP3336, HD2864 and CG1029) at eight centres (Bilaspur, Durgapura, Indore, Jabalpur, Junagadh, Powarkheda, Udaipur, Vijapur) under late (03rd December to 09th December) and very late (24th December to 31st December) sown conditions. The perusal of data showed significant effect of sowing time on yield (Fig. 8). On mean basis, there was significantly higher yield (33.31%) when crop sown under late sown conditions than very late sown condition. Test entry HD 3407 (41.61 q/ha) ranked 3rd which is statistically at par with check varieties CG 1029 (42.09 q/ha) and HD 2864 (41.86 q/ha).

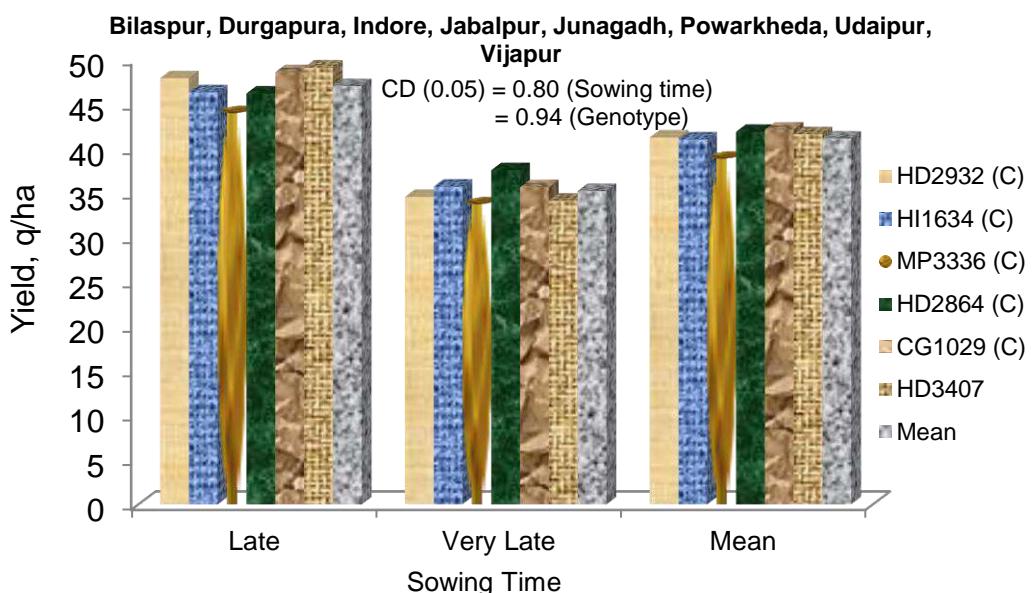

Fig. 8. Genotype performance under late and very late sown conditions in CZ

#### Restricted Irrigation

In restricted irrigation trial, four test entries HI 1655, CG 1036, HI 8830 (d) and DDW 55 (d) were evaluated against five check varieties (MP 3288, DBW 110, HI 8627 (d), DDW 47 (d) and HI 8823) at six locations (Bilaspur, Durgapura, Indore, Jabalpur, Powarkheda and Udaipur). For pooled analysis, data of Durgapura centre were not included due to low mean target yield and the data of Udaipur centre were not included in pooled analysis due to improper data reporting. The pooled analysis showed that successively increase in number of irrigations produced significantly higher yield (Fig. 9). Maximum ad significantly higher yield (38.77 q/ha) was obtained with two irrigations as compared with zero and one irrigations. The check variety DBW 110 ranked 1st (38.43 q/ha) followed by test entry CG 1036 (38.33 q/ha) and HI 8830 (d) (38.11 q/ha) and these three genotypes remained statistically at par on mean basis.

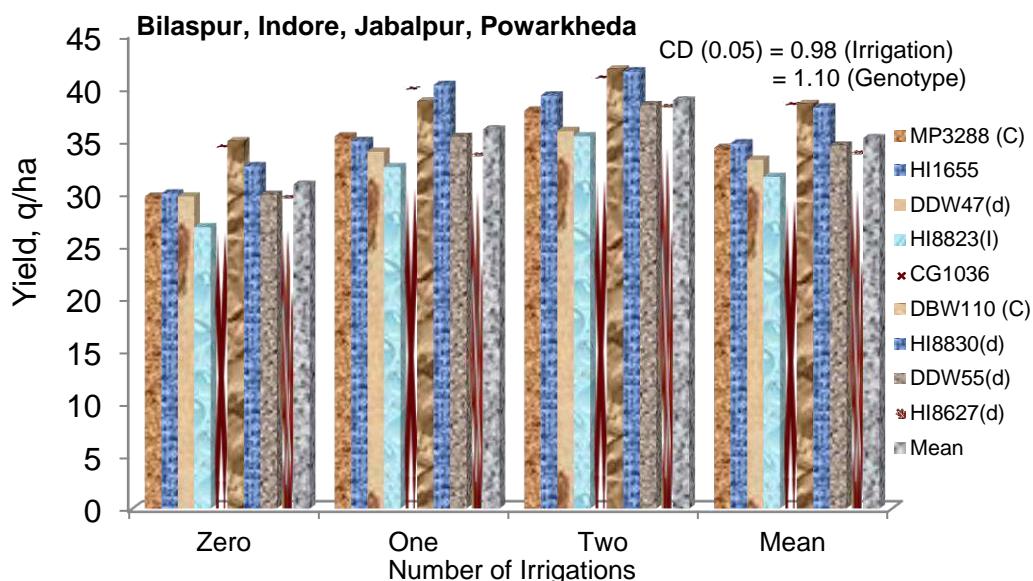

Fig. 9. Genotype performance under restricted irrigation conditions in CZ

### High Yield Potential Trial

The trial was conducted at five centres namely BISA Jabalpur, Jabalpur, Powarkheda, Udaipur and Vijapur. The pooled analysis showed significant effect of fertiliser application and growth regulators on yield (Fig. 10). Addition of 15 t FYM/ha with 150% RDF significantly increased the grain yield (11.09%) over RDF. Genotype GW322 remained top yielder (68.04 q/ha) followed by DBW 303 (66.68 q/ha) and both genotype remained at par but significantly higher than other genotypes.

### Peninsular Zone

In Peninsular zone, the performance of test genotypes was evaluated under two trials on sowing time (timely & late, and late & very late sown) at different locations. The results of these trials are summarized below.

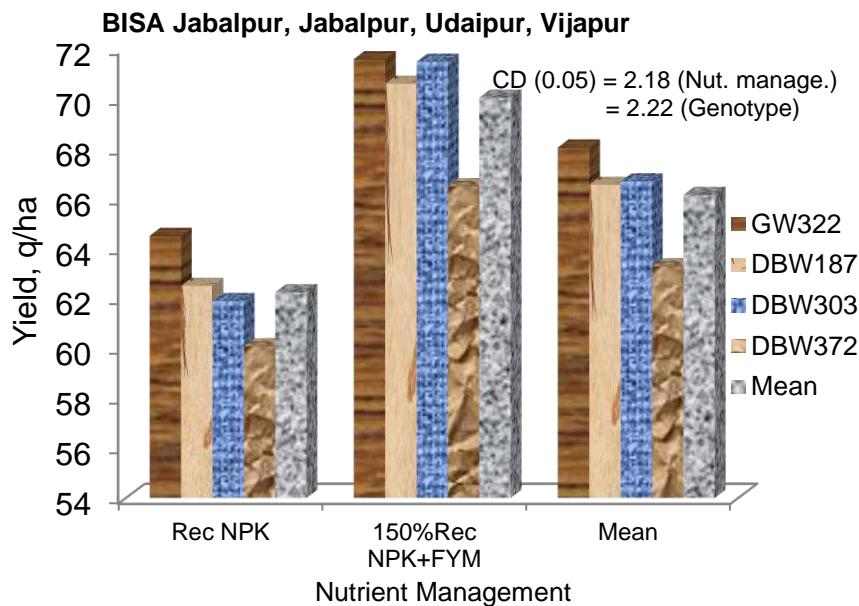

Fig. 10. Maximizing wheat productivity through fertilizer in CZ

#### Irrigated Timely Sown

In irrigated timely sown trial, the performance of two *durum* test entries (MACS4100, HI8826) over 3 check varieties (MACS3949, DDW48 and GW322) was evaluated under timely and late sown conditions at four locations *i.e.* Akola, Dharwad, Niphad and Pune. The perusal of pooled data of Akola and Niphad indicated that grain yield marginally reduced without a significant difference in changing of sowing from timely to late condition (Fig. 11). The mean grain yield under time and late sowing conditions was recorded to be 55.76 and 53.13 q/ha, respectively. Under timely sowing condition, test entry HI 8826 (63.01 q/ha) yielded exceedingly well as compared to best check variety MACS3949 (55.97 q/ha). The mean yield of HI8826(d) under timely sown condition was 12.58% higher than the yield of best check MACS3949.

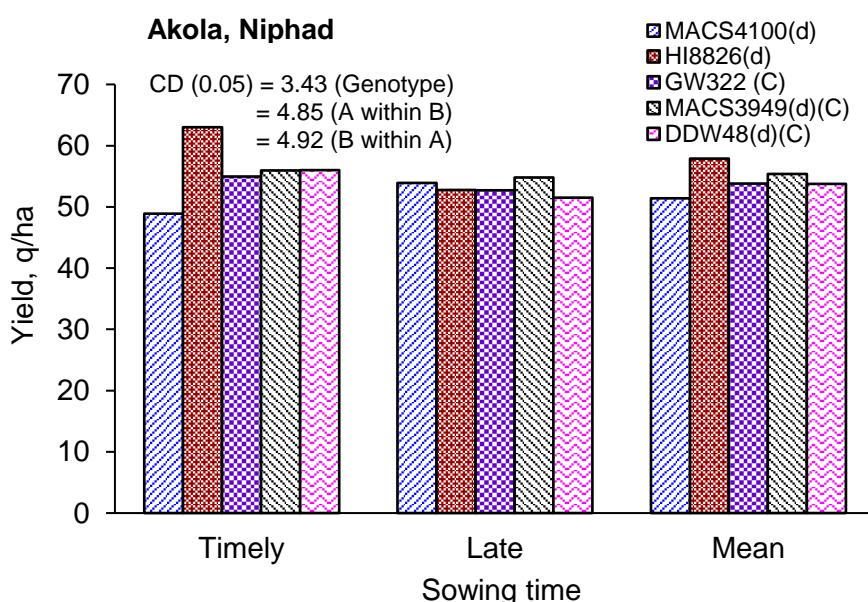

Fig. 11. Genotype performance under timely and late sown conditions in PZ

### Irrigated Late Sown

In irrigated late sown trial, the performance of one *aestivum* test entry DBW320 vis-à-vis four *aestivum* checks (HD3090, HI1633, HD2932, RAJ4083) was evaluated under late and very late sowing conditions at four centres (Akola, Dharwad, Niphad and Pune). The results of pooled data of Akola, Niphad and Pune centres revealed that grain yield declined drastically on shifting the sowing time from late to very late condition (Fig. 12). The mean grain yield under late and very late condition was observed to be 55.53 and 41.68 q/ha, respectively. In late as well as very late sown condition, the yield of test genotype DBW320 was lesser than those of best check variety HD2932.

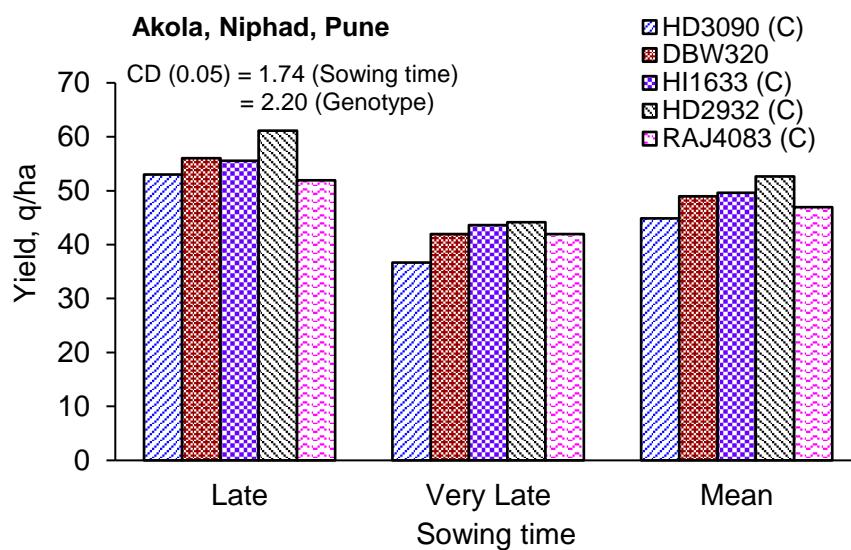

Fig. 12. Performance of genotypes under late and very late sown conditions in PZ

## PRODUCTION TECHNOLOGIES

In this section, the results of various experiments on updating the package of practices of various wheat growing zones are presented. Various special coordinated trials on weed control, nano urea, NPK solubilizing microbial consortium, maximizing production, use of sea-weed extract, use of RCTs in soybean-wheat system, lodging management, biofortification, fertigation in wheat were conducted to address the various issues in different wheat growing zones of the country.

### SPL -1: Efficacy of herbicides against diverse weed flora of wheat

Weeds are major problem in wheat production. Chemical weed control is preferred over other weed control methods in wheat. Moreover, wheat is infested with diverse weed flora and for control of complex weed flora herbicide combinations are required. Therefore, keeping these in view an experiment involving twelve weed control treatments was conducted across zones at 17 locations.

In NHZ, this trial was conducted at two locations (Bajaura and Malan). The pooled analysed of yield data of two centres are presented in Fig. 13(a). The minimum wheat grain yield (31.83 q/ha) was recorded with untreated weedy control on pooled basis. Among herbicide treatments, the maximum grain yield was recorded with pre em. tank mix combination of pendimethalin + pyroxasulfone at 1250 + 127.5 g/ha (Fig. 13(b)). Among herbicide treatments, at Malan, EPOST application of Pyroxasulfone + metsulfuron @ 127.5 + 4 g/ha recorded the lowest weed density and dry weight. Whereas, at Bajaura, pendimethalin at 1500 g/ha recorded the lowest weed density and dry weight.

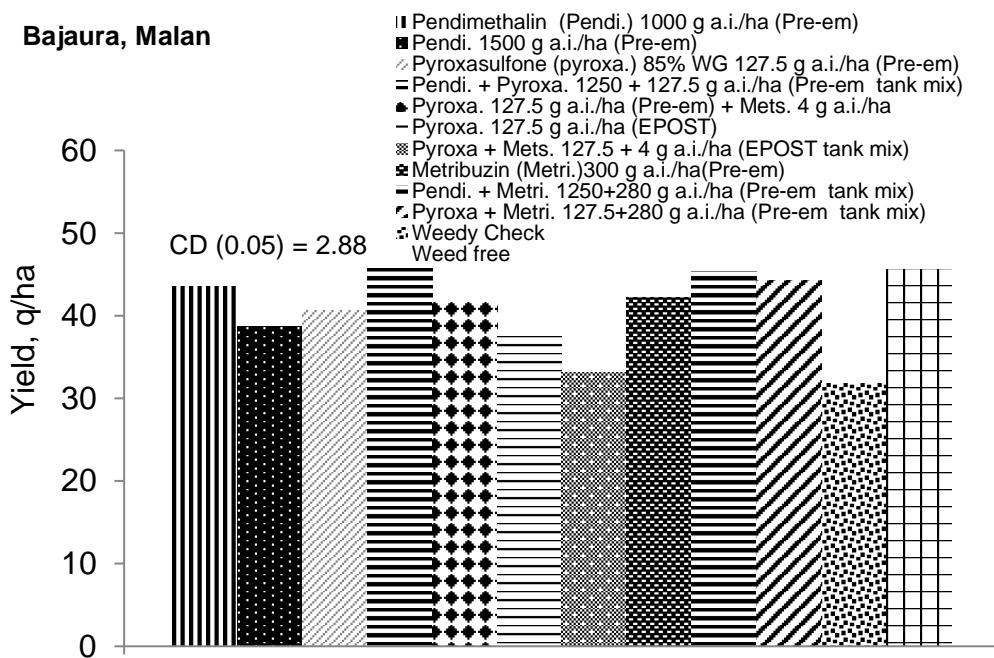

Fig. 13(a). Grain yield of wheat under different herbicides application in NHZ

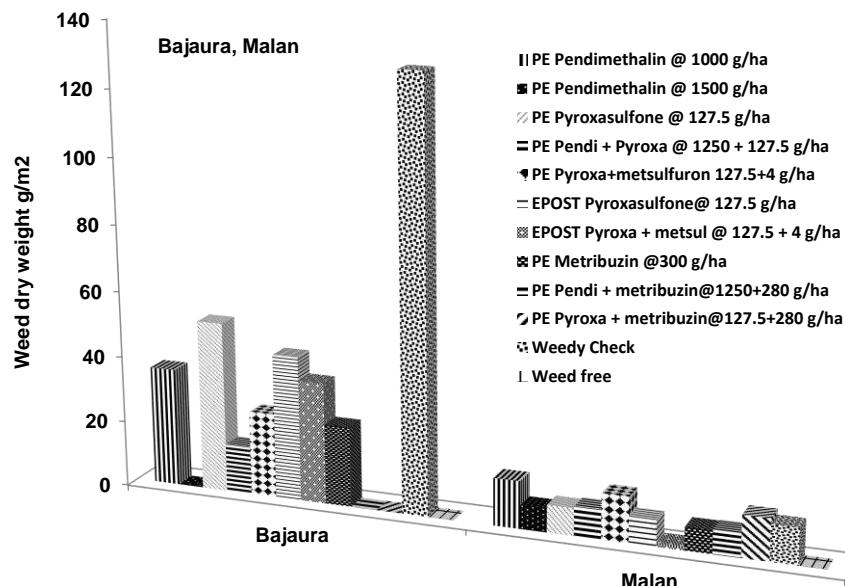

Fig. 13(b). Efficacy of herbicides against diverse weed flora of wheat in NHZ

In NWPZ, this trial was conducted at three centres namely Gurdaspur, Hisar and Jammu. The analysis of pooled data as shown in Fig. 14(a) and (b) revealed that herbicide application produced significant effect on grain yield and yield attributes. The highest yield was obtained under weed free situation (51.93 q/ha) which might be attributed to higher and better use of moisture, light, nutrients and space by the crop plants. Among herbicides, pre-emergence application of pyroxasulfone + metribuzin 127.5+280 g a.i./ha showed the least number of weed (16.9) and weed dry weight (15.4 g/ sq. m.) at 90 DAS as compared to values of these traits as 112.6 and 161.5, respectively, under weedy check condition followed by pre-emergence tank mix application of pendimethalin + metribuzin at 1280 + 280 g a.i./ha has resulted into less weed count (19.3) and reduced weed dry weight (21.1 g/sq. m.) at 90 DAS.

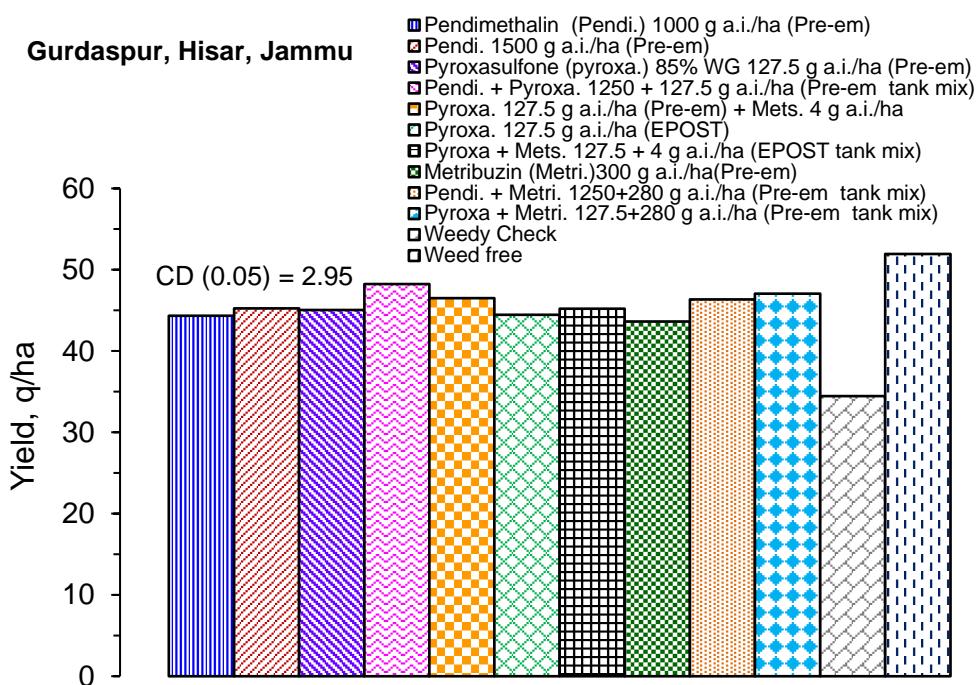

Fig. 14(a). Grain yield of wheat under different herbicides application in NWPZ

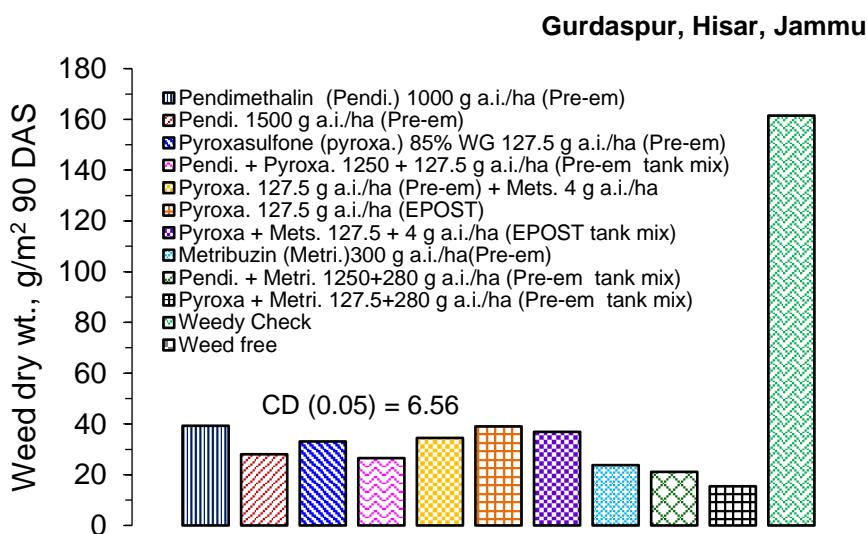

Fig. 14(b). Efficacy of herbicides against diverse weed flora of wheat in NWPZ

In NEPZ, this experiment was conducted at four locations (Ayodhya, Ranchi, RPCAU PUSA and Shillongani). The maximum grain yield (49.2 q/ha) was obtained in weed free condition which was at par to pre-emergence tank mix application of Pendimethalin + metribuzin @1250+280 g a.i./ha, Pre-emergence tank mix application of Pyroxasulfone + metribuzin @127.5+280 g a.i./ha and early post emergence tank mix application of Pyroxasulfone+ metsulfuron @ 127.5 + 4 g a.i./ha {Fig. 15(a) and (b)}. The yield gain in weed free condition over weedy check was 56.7 %. The weed count and weed dry weight was reduced significantly by pre-emergence tank mix application of Pyroxasulfone + metribuzin @127.5+280 g a.i./ha and pre-emergence tank mix application of Pendimethalin + metribuzin @1250+280 g a.i./ha at all growth stages.

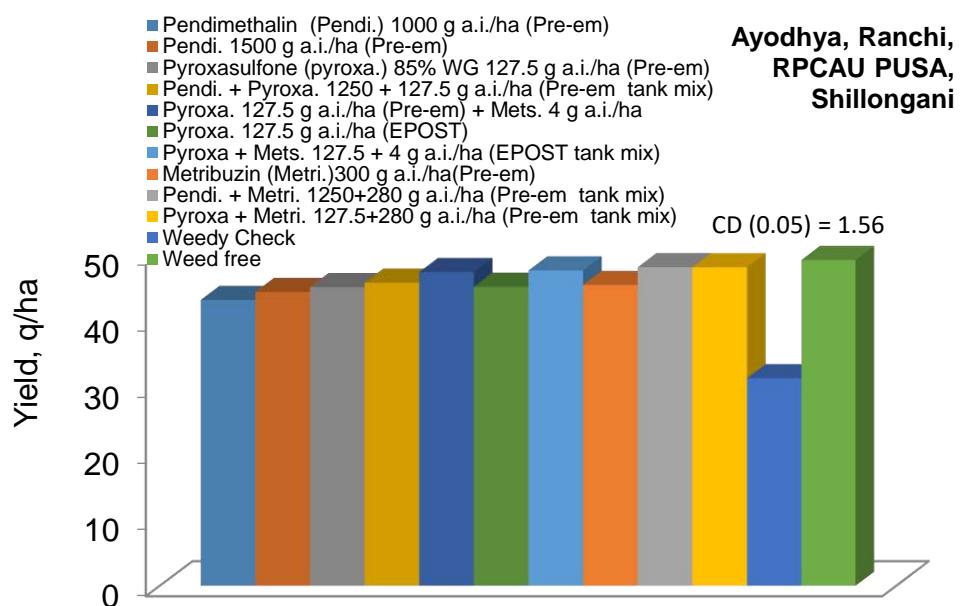

Fig. 15 (a). Grain yield of wheat under different herbicides application in NEPZ

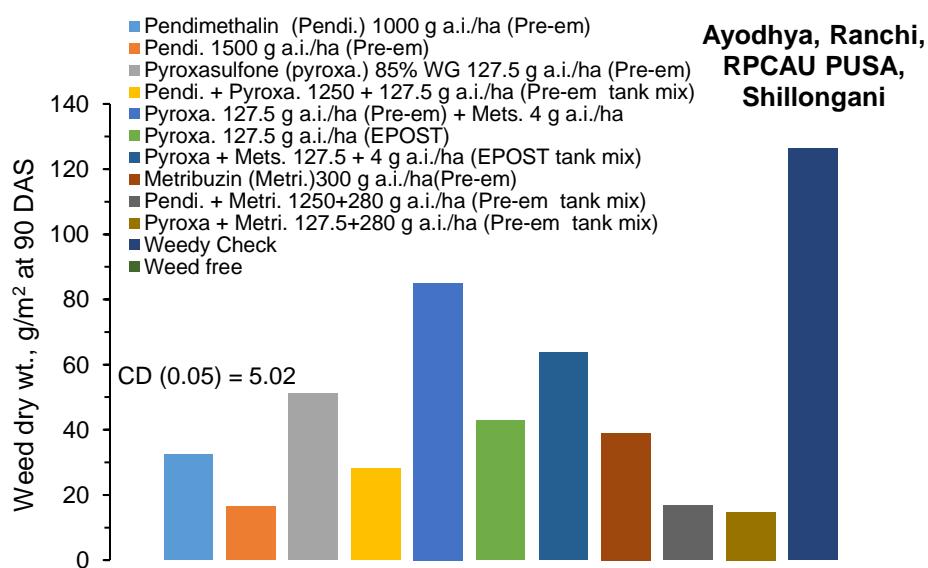

Fig. 15(b). Efficacy of herbicides against diverse weed flora of wheat in NEPZ

In CZ, this trial was conducted at six locations (Bilaspur, Durgapura, Jabalpur, Junagadh, Powarkheda, Indore). The pooled analysis of data {Fig. 16(a) and (b)} revealed that treatment having EPOST tank mix application of Pyroxasulfone + metsulfuron @127.5 + 4 g a.i./ha produced significantly higher grain yield (52.30 q/ha), thousand grains weight (47.33, g) and earhead/m<sup>2</sup> (387), stand count (161) as compared other treatments.

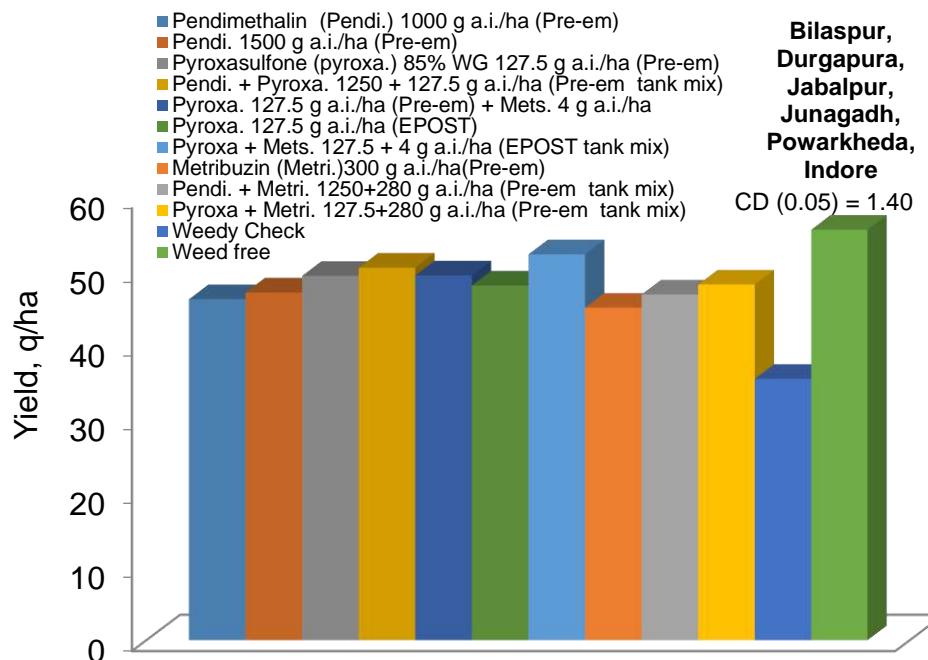

Fig. 16(a). Grain yield of wheat under different herbicides application in CZ

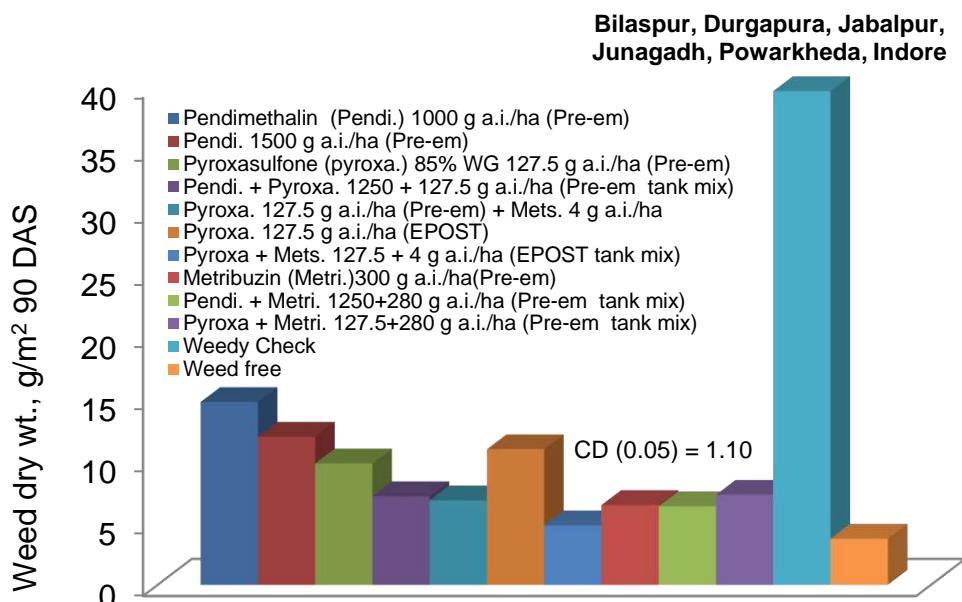

Fig. 16(b). Efficacy of herbicides against diverse weed flora of wheat in CZ

In PZ, this trial was conducted at Dharwad and Pune centres. The results of pooled data are presented in Fig. 17(a) and (b). It was observed that herbicide application produced effect on

grain yield which was found maximum (52.20 q/ha) under weed free conditions. In terms of herbicide performance, pre-emergence application of pendimethalin @1500 g a.i./ha resulted into minimum weed count (7.03) and weed dry weight (5.25 g/sq.m.) at 90 DAS over weed count (22.08) and weed dry weight (21.55 g/sq.m.) at 90 DAS, respectively, under weedy check condition.

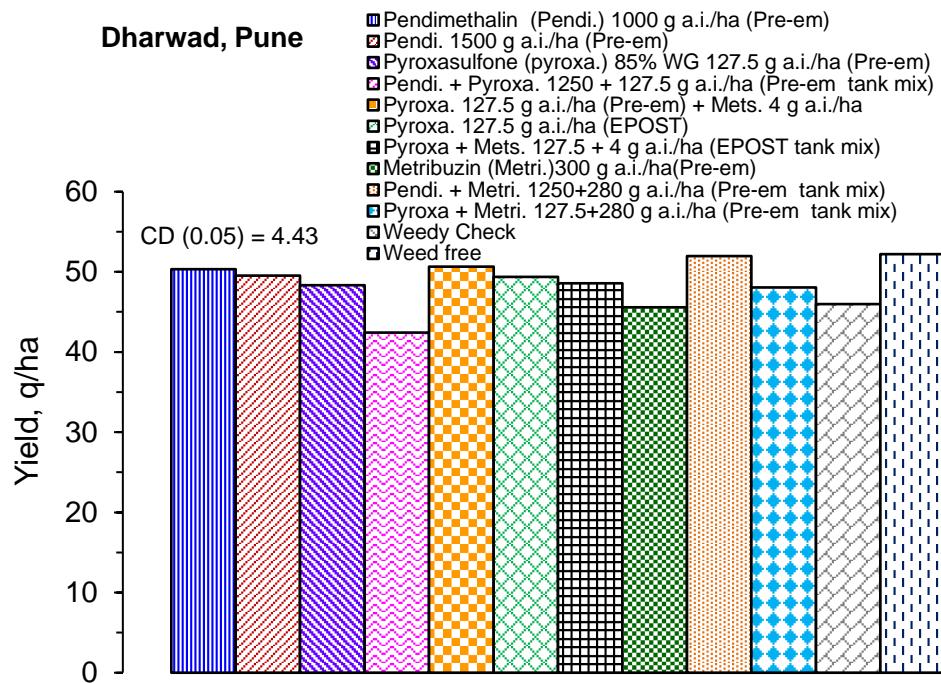

Fig. 17(a). Grain yield of wheat under different herbicides application in PZ

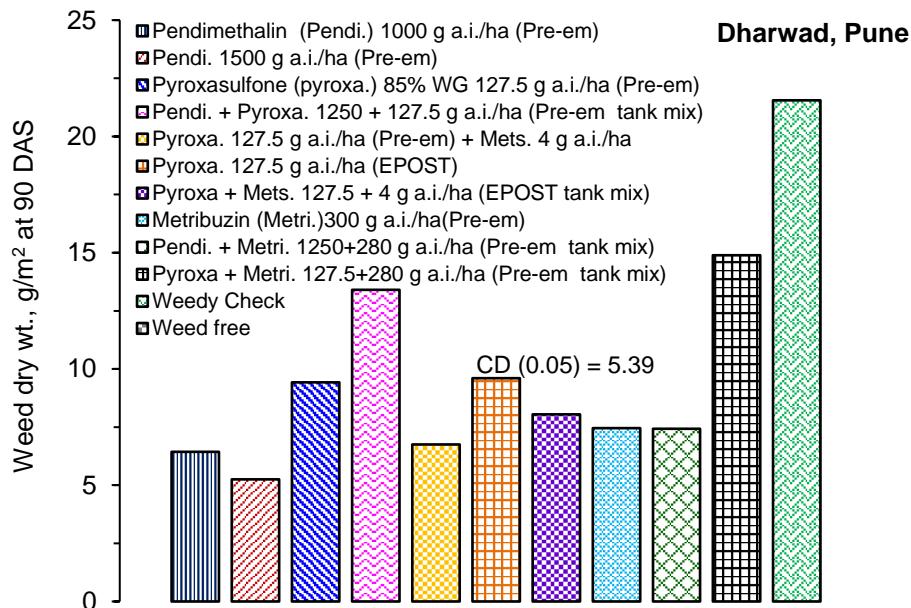

Fig. 17(b). Efficacy of herbicides against diverse weed flora of wheat in PZ

## SPL-2: Sea weed extract usage in wheat

In NHZ, this experiment was conducted at two locations (Bajaura and Malan). The perusal of pooled data presented in Fig. 18 revealed that maximum wheat grain yield (47.56 q/ha) was obtained in treatment where wheat seeds were treated with sea weed extract followed by two foliar spray of sea weed extract 4ml/litre of water at tillering and heading. This treatment resulted in higher yield due to better earhead density (422/sq.m.), heavier grains weight (43.55 g/1000 grains weight), more number of grains per earhead (26.22) and the highest biomass production (107.48 q/ha). Seed treatment with sea weed extract at the rate of 3.0 ml per kg of weed seed before sowing of the crop also resulted in significantly higher grain and biomass yield (Table 6.2) as compared to control (without seed treatment).

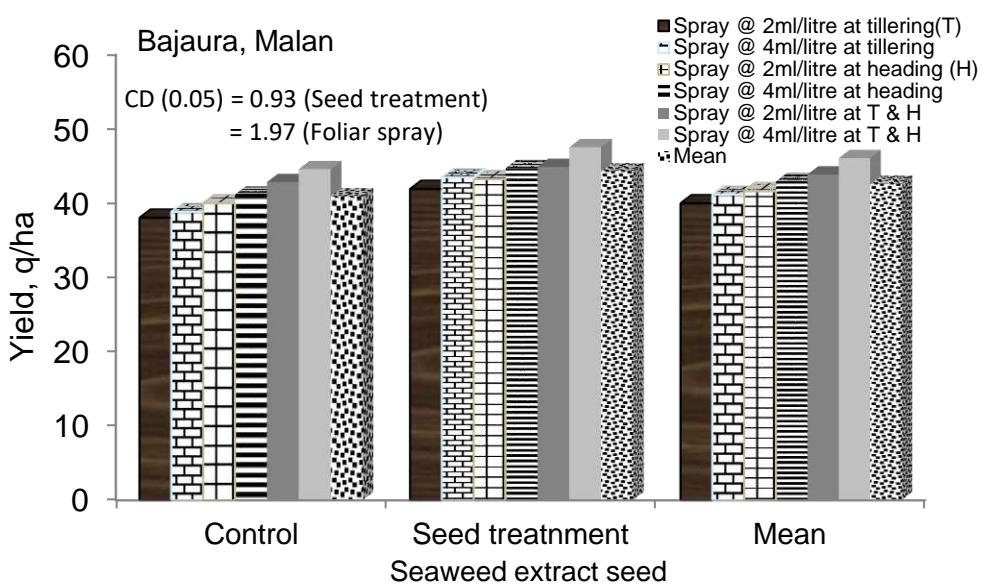

Fig. 18. Effect of seaweed extract on wheat productivity in NHZ

In NWPZ, the experiment on seaweed extract was conducted at three locations (Delhi, Gurdaspur and Jammu). The perusal of pooled analysis data presented in Fig. 19 showed that seed treatment with seaweed extract made significant increase in grain yield (51.65 q/ha) over untreated control (50.92 q/ha). The maximum mean grain yield (53.18 q/ha) was observed with two foliar spray of seaweed extract using 4 ml/lit dose at tillering and heading stages followed by two foliar spray of seaweed extract using 2 ml/lit dose at tillering and heading stages (52.13 q/ha).

In NEPZ, this experiment was conducted at four locations (Coochbehar, Ranchi, Sabour, and Varanasi). There was non-significant effect of seed treatment and foliar application on the grain yield (Fig. 20). The maximum grain yield (48.66 q/ha) was obtained by foliar application of seaweed extract @ 4ml/litre water at tillering stage.

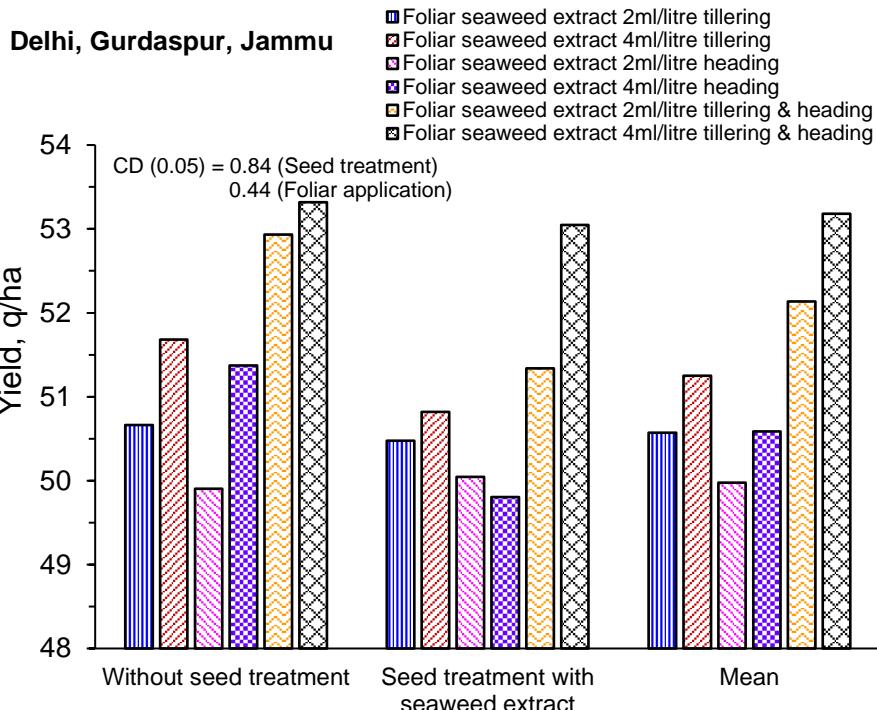

Fig. 19. Effect of seaweed extract on wheat productivity in NWPZ

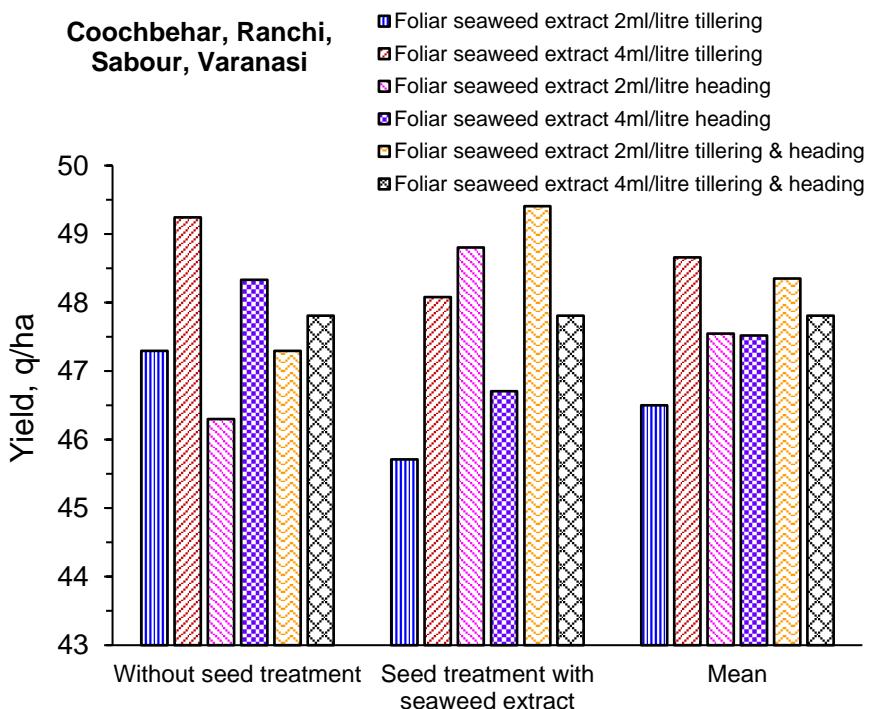

Fig. 20. Effect of seaweed extract on wheat productivity in NEPZ

In CZ, this trial was conducted at three locations (Dhanduka, Durgapura and Udaipur) and perusal of pooled data (Fig. 21) revealed that maximum grain yield (52.42 q/ha) was recorded in treatment foliar application of seaweed extract @ 4ml/litre water at tillering & heading treatment which was significantly higher than all other treatments followed by foliar application of seaweed extract @ 2ml/litre water at tillering & heading stage (49.91 q/ha).

Seed treated with seaweed extract also produce significantly higher grain yield (45.91 q/ha) than untreated seed (42.13 q/ha).

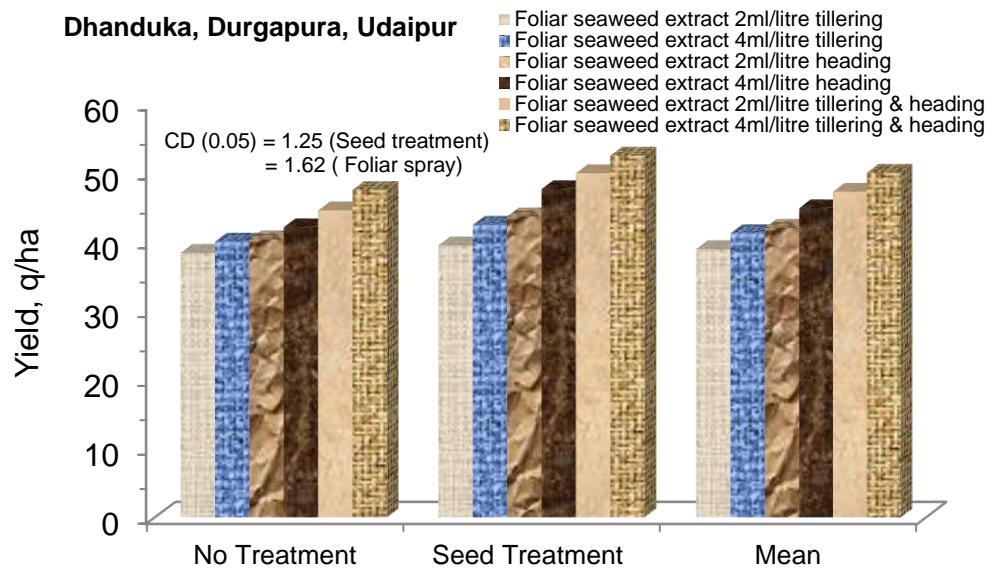

Fig. 21. Effect of seaweed extract on wheat productivity in CZ

In PZ, this experiment was conducted at Akola, Dharwad and Niphad centres. The results of pooled data revealed that seed treatment and foliar application of seaweed extract had significant effects on wheat yield (Fig. 22). The maximum wheat yield of 44.68 q/ha was observed with seed treatment and foliar application of seaweed extract @4ml/litre water at tillering stage.

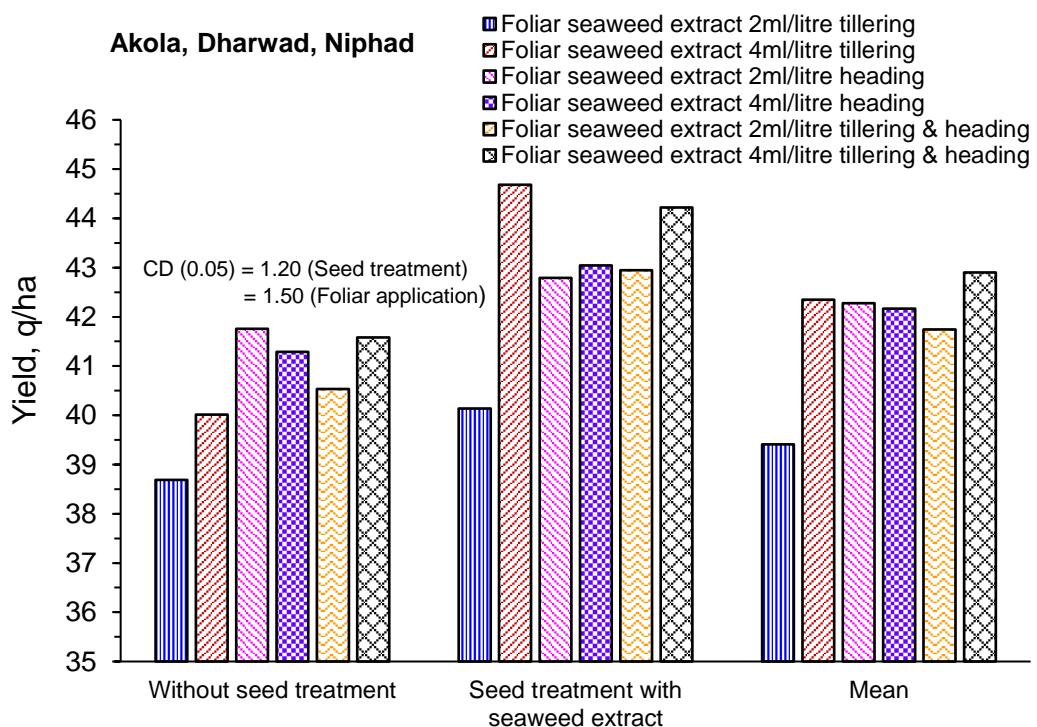

Fig. 22. Effect of seaweed extract on wheat productivity in PZ

### SPL- 3: Effect of nano urea under irrigated conditions

This experiment was conducted to explore the possibility of maximizing wheat productivity by integrated use of nano urea. The experiment was laid out in randomised complete block design with thirteen treatments viz. control (No N) and 50, 75 and 100% of Rec N rates along with either one or two spray of nano urea or two spray of simple urea (5%). One third nitrogen as per treatment, full phosphorus and potash as basal dose and the remaining 2/3<sup>rd</sup> nitrogen as 1/3<sup>rd</sup> at first irrigation and 1/3<sup>rd</sup> at second irrigation were applied. Irrigation and weed control measures were followed as per recommended package of practices for the concerned zone.

In NHZ, this experiment was conducted at Almora centre only. The data are presented in Fig. 23 showed that the lowest grain yield (24.52 q/ha) was recorded in no N application control treatment. In comparison to control, all the treatments caused significant yield improvement. No specific trend with regards to nano urea applications was observed.

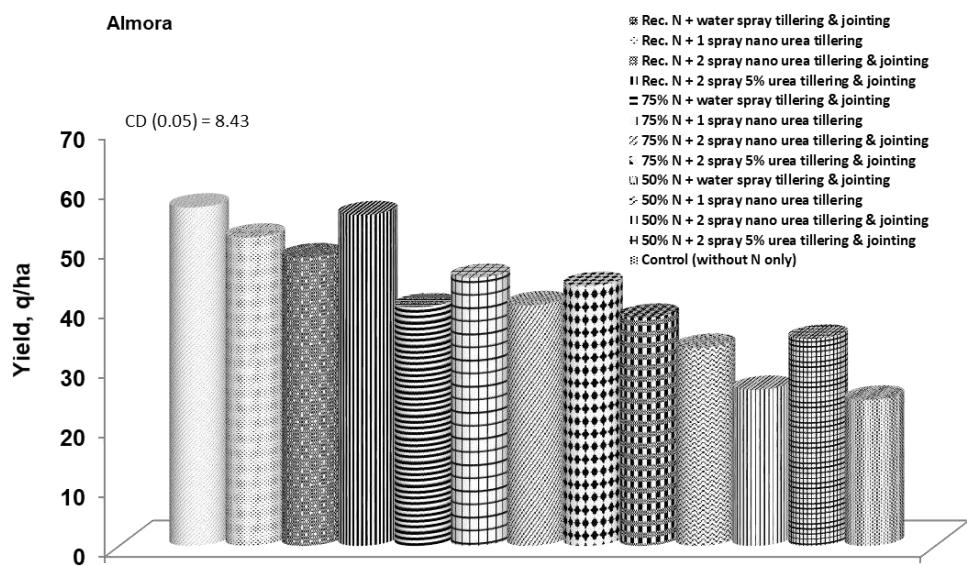

Fig. 23. Effect of nano urea on productivity of wheat in NHZ

In NWPZ, this experiment was conducted at eight locations (Delhi, Gurdaspur, Gwalior, Hisar, Jammu, Karnal, Ludhiana and Panthagar). The perusal of pooled analysis data presented in Fig. 24 showed that application of recommended N and two spray of nano urea at tillering and jointing stage produced the maximum grain yield of 50.52 q/ha. However, the grain yield with rec. N + two spray of simple urea (5%) at tillering and joining stage (49.45 q/ha) and with rec. N + one spray of nano urea at tillering (49.26 q/ha) were at par with rec. N + two sprays of nano urea. The addition of two spray of nano urea at tillering and jointing stage with recommended N fertilization brought about an increase of 6.38% in grain yield over rec. N treatment. The yield gain might be due to

the bolder grains with thousand grains weight of 38.16 g in nano urea spray against 36.93 g for recommended dose of N fertilizer without any spray.

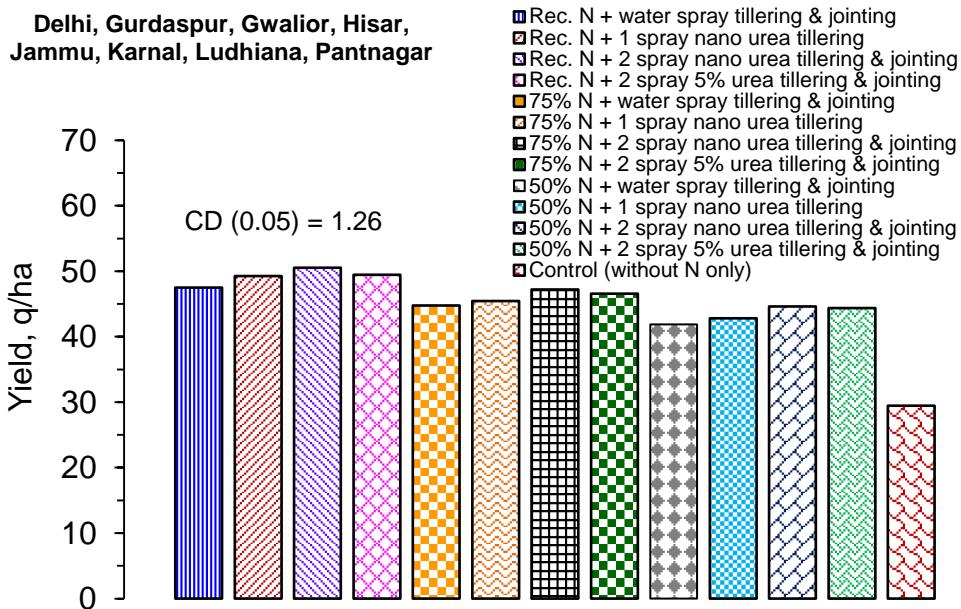

Fig. 24. Effect of nano urea on productivity of wheat in NWPZ

In NEPZ, this experiment was conducted at five locations (Burdwan, Coochbehar, Ranchi, Sabour and Varanasi). The maximum grain yield (48.23 q/ha) was obtained under recommended N Dose+ two spray of nano urea at tillering & jointing stage treatment, which was at par to recommended N Dose + water spray at 45 & 65 Days after sowing, recommended N Dose+ one spray of nano urea at tillering and recommended N Dose+ two spray of urea (5%) at tillering & jointing and was significantly superior to all other treatments (Fig. 25).

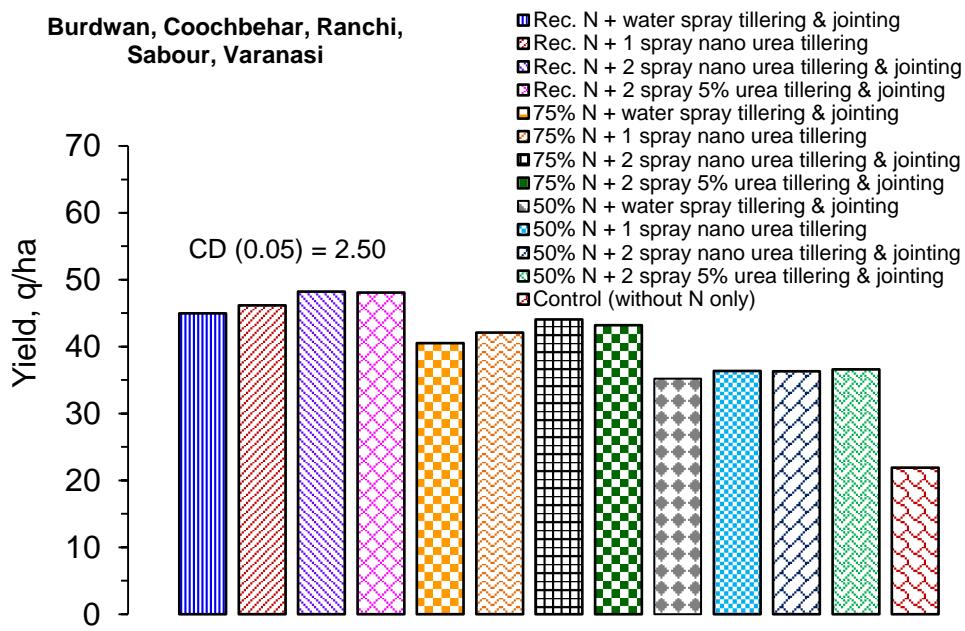

Fig. 25. Effect of nano urea on productivity of wheat in NEPZ

In CZ, this trial was conducted at seven locations (Bilaspur, Durgapura, Jabalpur, Junagadh, Powarkheda, Indore, Vijapur). The experiment was conducted with thirteen N treatment combinations in three replications. The pooled analysis of data (Fig. 26) revealed that maximum grain yield (54.02 q/ha) was produced in the treatment of rec. N+ two spray of nano urea at tillering and jointing, followed by rec. N+ two spray of urea (5%) at tillering and jointing (53.13 q/ha) and rec. N+ one spray of nano urea at tillering (52.34 q/ha) and all the three treatments were found statistically at par.

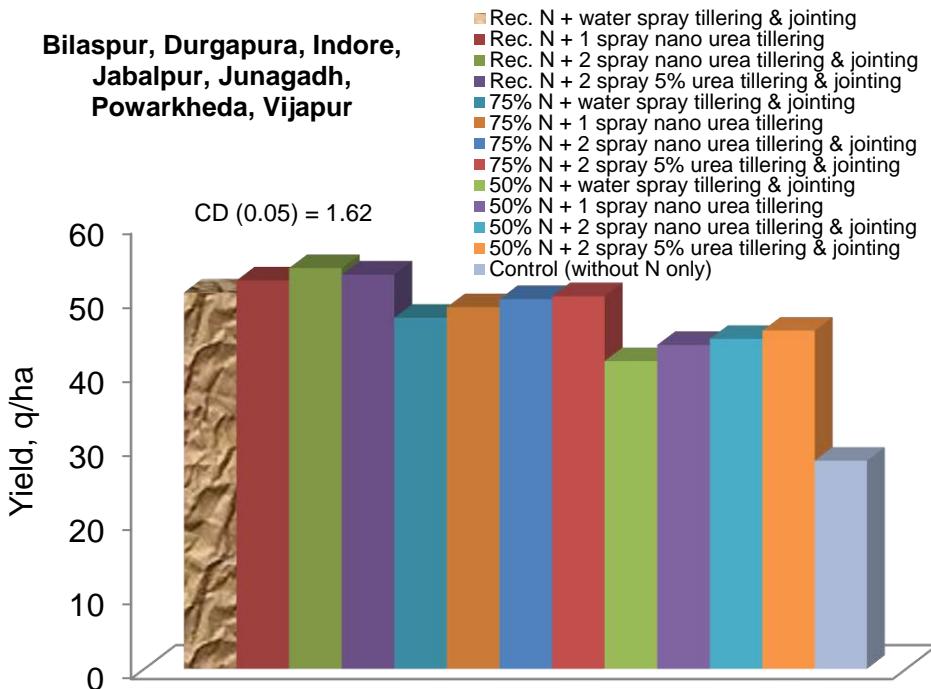

Fig. 26. Effect of nano urea on productivity of wheat in CZ

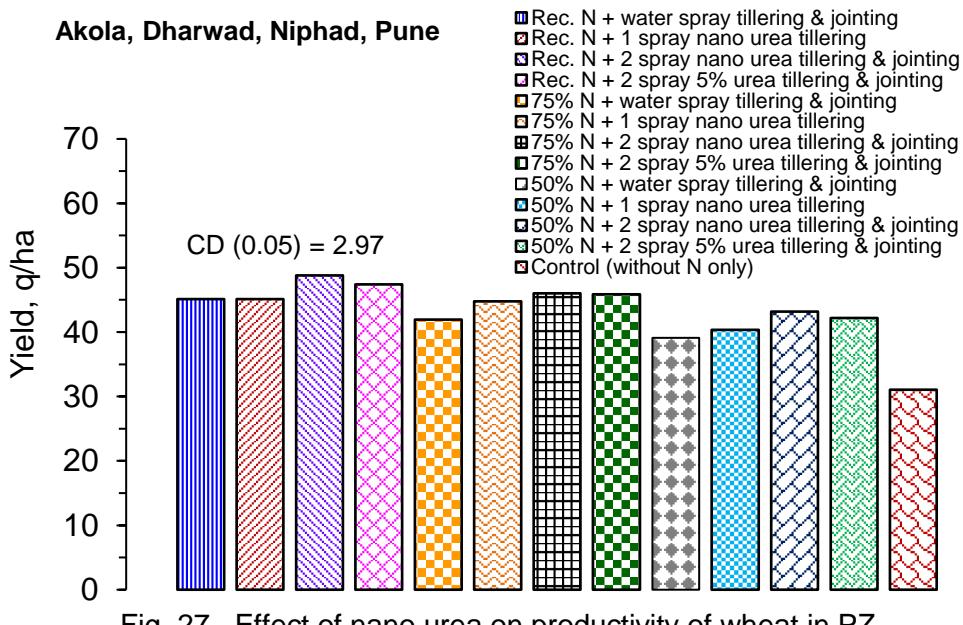

Fig. 27. Effect of nano urea on productivity of wheat in PZ

In PZ, this experiment was conducted at Akola, Dharwad, Niphad and Pune centres. The results of pooled data presented in Fig. 27 shows that the maximum grain yield of 48.78 q/ha was found with the application of recommended N and two spray of nano urea at tillering and jointing stage. However, the treatment of two spray of urea (5%) at tillering and joining stage also produced the statistically similar yield. The addition of two spray of nano urea at tillering and jointing stage with recommended N fertilization increased the grain yield by 8.14% as compared to base treatment (rec. N only).

#### **SPL- 4: Effect of nano urea under restricted irrigation conditions**

In NHZ, this trial was conducted at one location namely Bajaura. The data presented in Fig. 28 clearly revealed that significantly highest wheat grain yield (54.24 q/ha) was obtained by applying recommended dose of N along with spray of urea (5%) + nano urea at tillering stage. The minimum grain yield (20.45 q/ha) was recorded in absolute control (No nitrogen). Compared to control treatment, application of two spray of nano urea alone at tillering and jointing significantly increased the grain yield (26.18 q/ha). Also, compared to recommended N, one or two spray of either nano urea or urea significantly improved the grain yield.

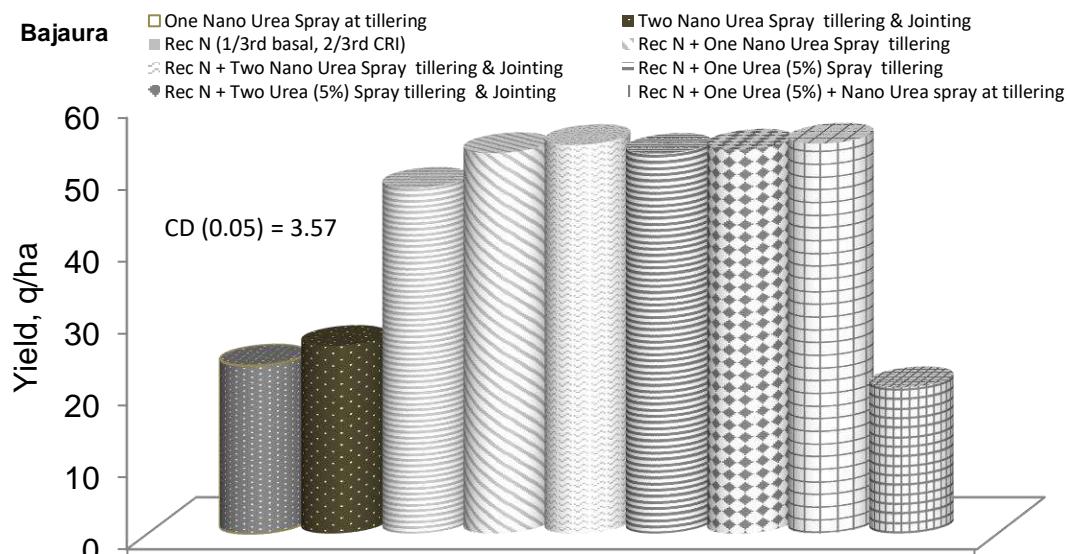

Fig. 28. Effect of nano urea on wheat productivity under restricted irrigation in NHZ

In NWPZ, this experiment was conducted at four locations (Gwalior, Hisar, Karnal and Pantnagar). The perusal of pooled analysis data presented in Fig. 29 showed that application of recommended N and two spray of nano urea at tillering and jointing stage produced the maximum grain yield of 47.70 q/ha followed by recommended N and one spray of 5% urea + one spray of nano urea at tillering stage (47.11 q/ha) which was at par with former. The addition of two spray of nano urea at tillering and jointing stage with recommended N fertilization recorded an increase of 4.88% in grain yield over rec. N treatment.

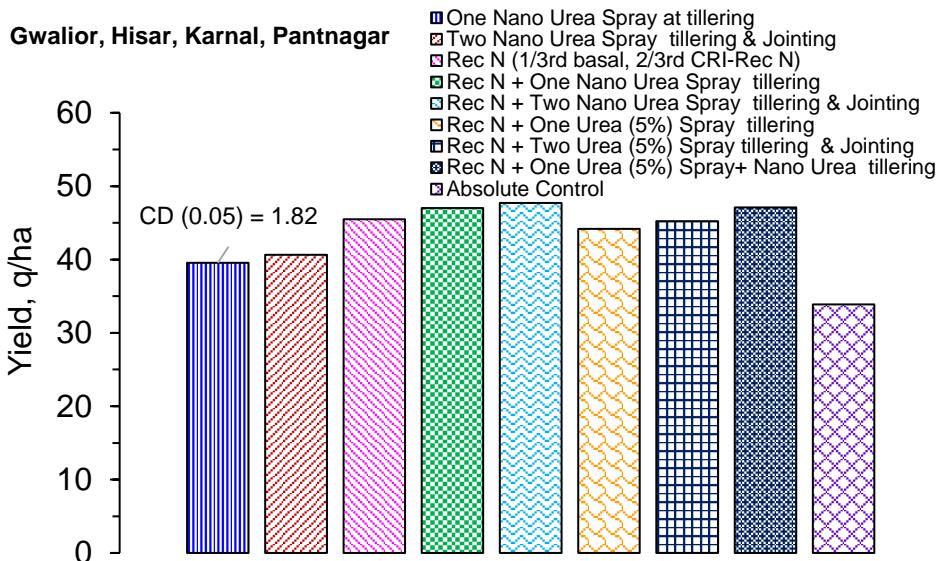

Fig. 29. Effect of nano urea on wheat productivity under restricted irrigation in NWPZ

In NEPZ, this experiment was conducted at five locations (Ayodhya, Burdwan, Kanpur, RPCAU PUSA and Shillongani). Burdwan centre was excluded due to very low yield. The maximum grain yield (45.8 q/ha) was obtained under recommended N + one spray of urea (5%) + nano urea at tillering (40-45 DAS), which was at par to recommended N + two sprays of urea (5%) at tillering (40-45) and jointing (60-65 DAS) and was significantly superior to all other treatments (Fig. 30).

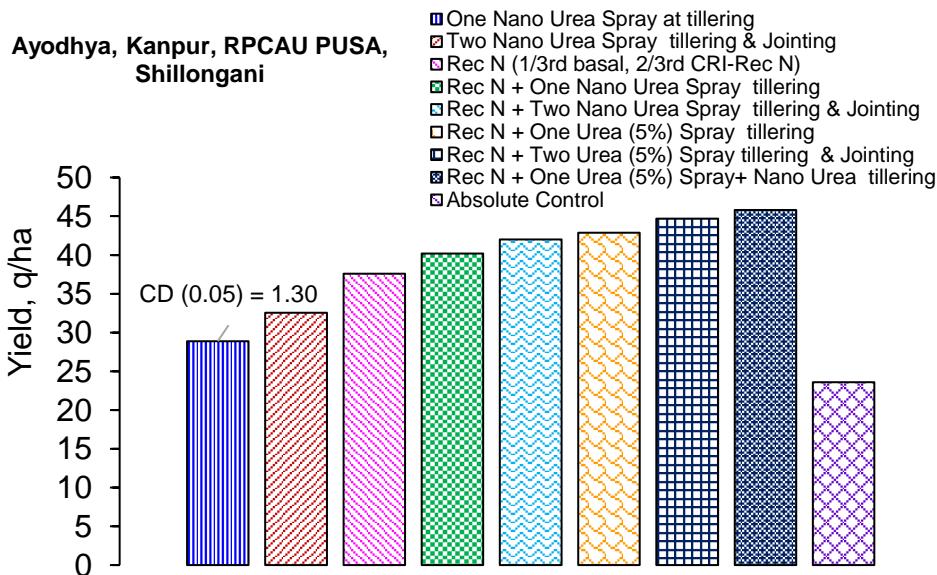

Fig. 30. Effect of nano urea on wheat productivity under restricted irrigation in NEPZ

In CZ, this trial was conducted at three locations (Indore, Udaipur, Vijapur) with nine N treatment combinations and two irrigation levels. The pooled analysis of data of three centres (Fig. 31) revealed that maximum grain yield (46.08.02 q/ha) was produced in treatment rec. N + two spray of nano urea at tillering and jointing followed by rec N + two

spray of urea (5%) at tillering and jointing (44.40 q/ha) and both treatment remained statistically at par.

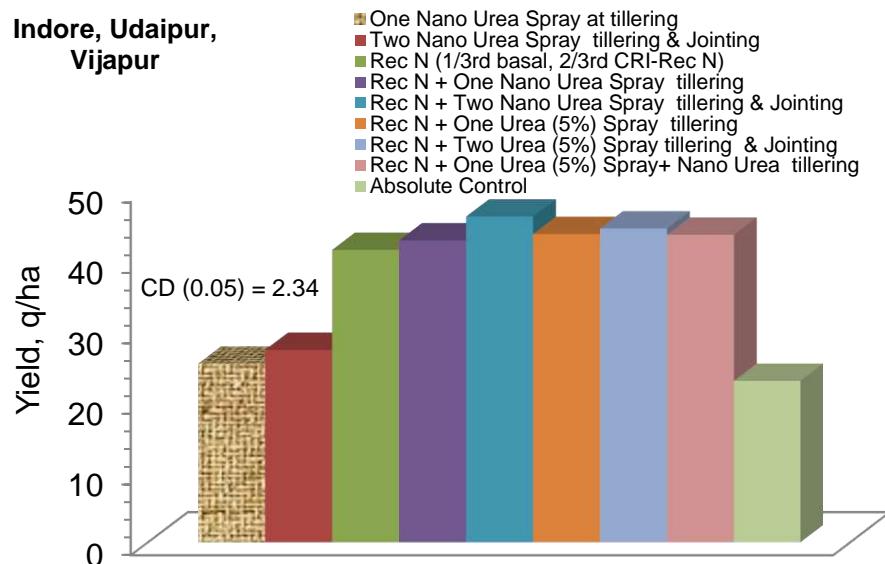

Fig. 31. Effect of nano urea on wheat productivity under restricted irrigation in CZ

#### SPL-5: Lodging management of *dicoccum* wheat using PGR

The experiment was laid out in split plot design with three varieties (MACS 2971, DDK 1029 and HW 1098) in main plot treatments and five growth regulator treatments {G1: Control; G2: CCC (2 chloroethyl- trimethyl ammonium chloride) @ 1000 ppm; G3: CCC @ 1500 ppm; G4: Ethepron @ 10 ppm and G5: Ethepron @ 30 ppm} in sub plots. Nutrient application consisted of 120:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O/ha. One third nitrogen, full phosphorus and potash were applied as basal dose and the remaining 2/3<sup>rd</sup> nitrogen as 1/3<sup>rd</sup> at first irrigation and 1/3<sup>rd</sup> at second irrigation.

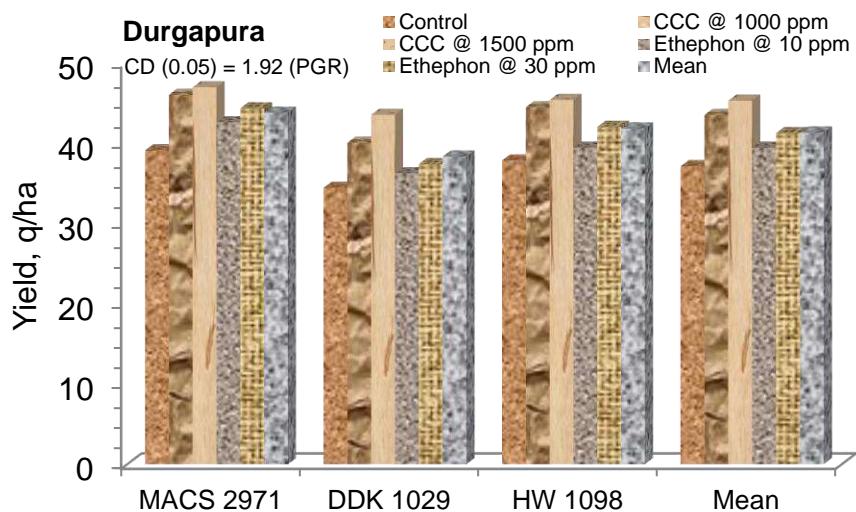

Fig. 32. Enhancing productivity of *dicoccum* wheat by using PGR in CZ

In CZ, this trial was conducted only at Durgapura centre with three genotypes and five growth regulator combinations. The data (Fig. 32) revealed that all three genotypes produce statistically at par yield and plant growth regulator treatment CCC (2 chloroethyl- trimethyl ammonium chloride) @1500 ppm was significantly superior and ranked first with 45.27 q/ha yield.

In PZ, this experiment was conducted at Dharwad, Niphad and Pune centres to explore the possibility of reducing lodging for yield enhancement of *dicoccum* wheat using plant growth regulators. The results of pooled data presented in Fig. 33 revealed that the effect of variety and growth regulator on grain yield was significant. Among all treatments, the maximum yield of 49.56 q/ha was observed for MACS 2971 variety with application of Ethephon @10 ppm. On mean basis, that application of CCC (2 chloroethyl- trimethyl ammonium chloride) @1500 ppm produced the maximum mean grain yield of 47.03 q/ha.

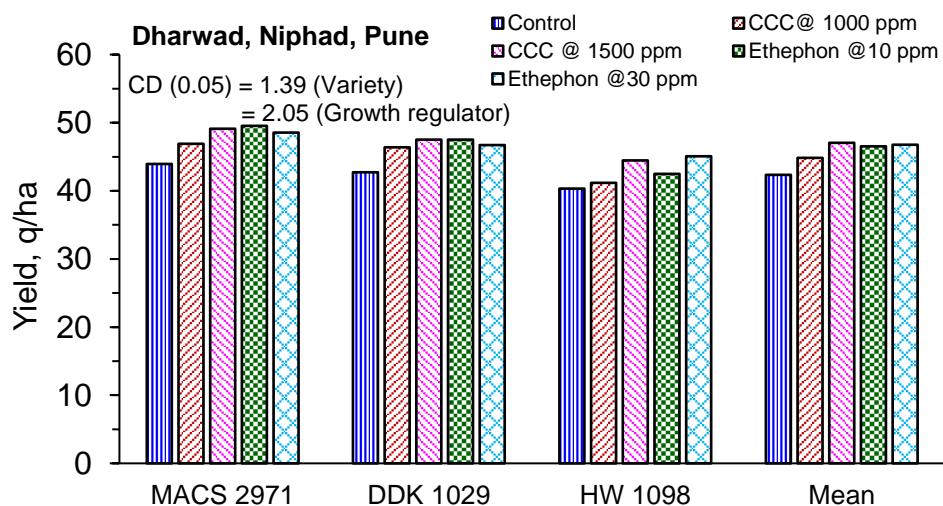

Fig. 33. Enhancing the yield potential of improved *dicoccum* wheat by using growth regulators in PZ

#### **SPL-6: Resource conservation techniques for enhancing the productivity and resource-use efficiency of soybean-wheat cropping system**

In PZ, this experiment was conducted at Dharwad, Niphad and Pune centres to evaluate the effect of resource conservation technologies on performance of soybean-wheat cropping system. The results of pooled data presented in Fig. 34 suggest that the highest grain yield of 58.99 q/ha was found under conventionally tilled broad bed method; however, effect of tillage method on grain yield was not significant. The combined use of soybean and wheat residue @3 t/ha each produced 10.53% higher grain yield than control treatment (no residue).

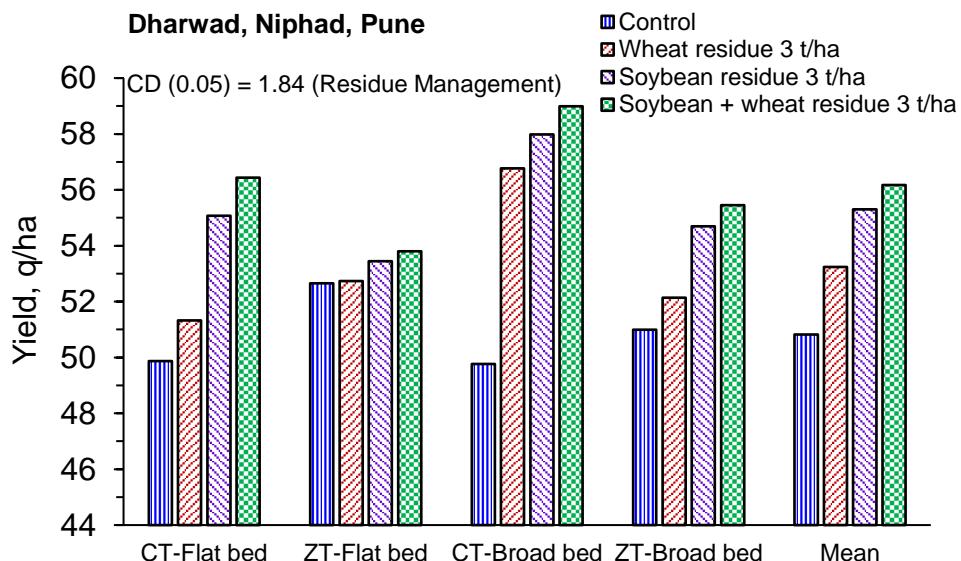

Fig. 34. Wheat productivity under RCTs in soybean-wheat cropping system in PZ

#### **SPL-7: Precision nutrient management for higher yield in wheat through fertigation**

In PZ, this experiment was conducted at Dharwad centre with an objective of increasing wheat yield through fertigation under surface and subsurface irrigation methods. The results presented in Fig. 35 revealed that drip irrigation could not produce significant effect on grain yield. The treatment of nutrient management made significant effect on grain yield which was the maximum (43.64 q/ha) with 100% NPK through water soluble fertilizer at fortnight interval under subsurface drip irrigation. The mean yield (42.69 q/ha) under this treatment was 17.83% higher than control treatment (surface irrigation with 100% RDF).

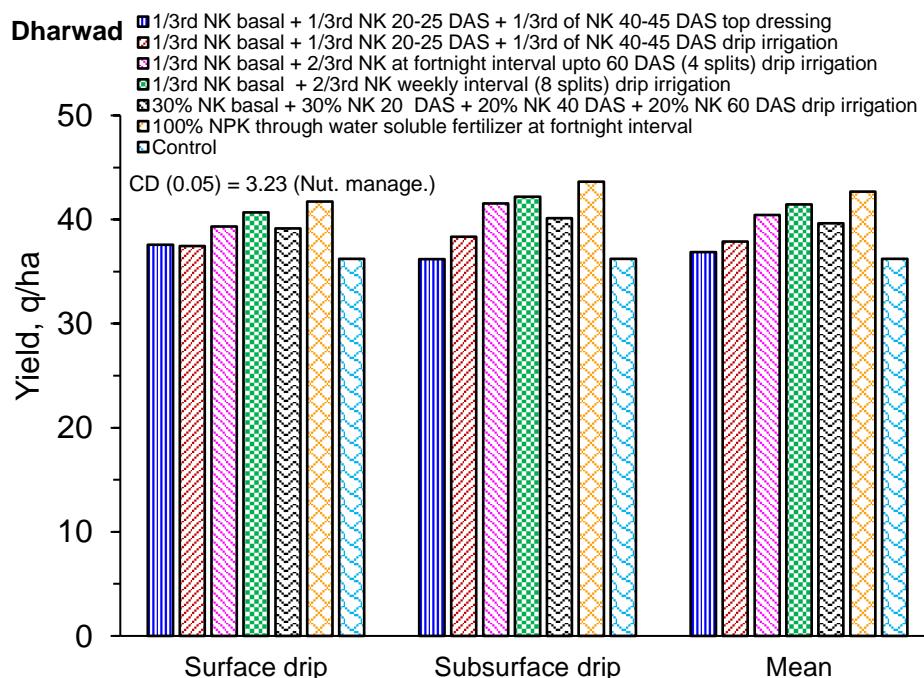

Fig. 35. Wheat yield under precise nutrient management through fertigation in PZ

#### **SPL-8: Improving wheat yield through foliar K application**

In NWPZ, the experiment on foliar K application was conducted at one location at Jammu only. The perusal of data presented in Fig. 36 showed that number of irrigations brought significant effect on grain yield, earheads, grains/earhead and biomass. The maximum mean grain yield of 38.53 q/ha was observed with three irrigations, which was 40.26 and 6.82% higher than mean grain yield under one and two irrigation condition, respectively. Among treatments in sub-plots, the mean grain yield (34.78 q/ha) was the maximum with 4% K application and numerically better than 34.14 and 33.14 q/ha under 2% K application and control, respectively.

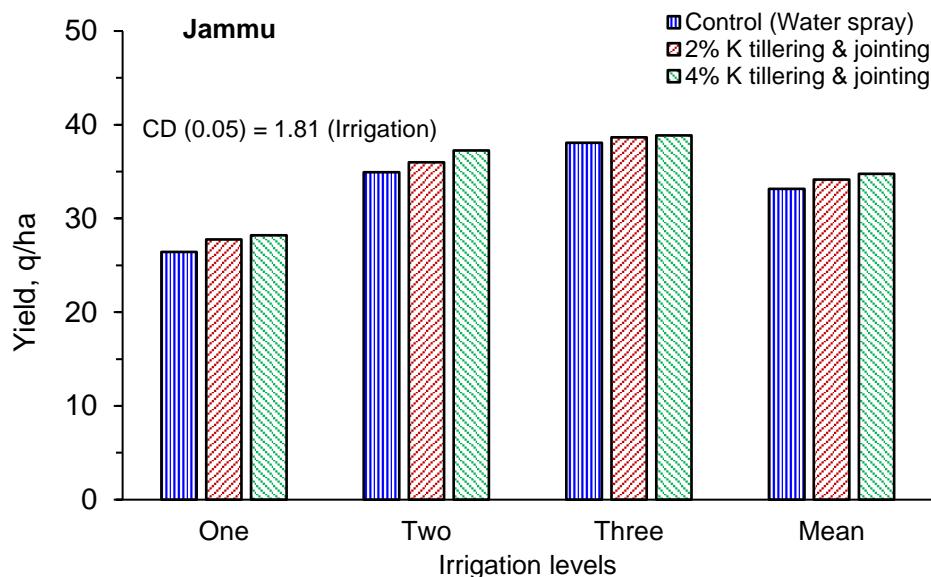

Fig. 36. Wheat productivity under irrigation levels and foliar K application in NWPZ

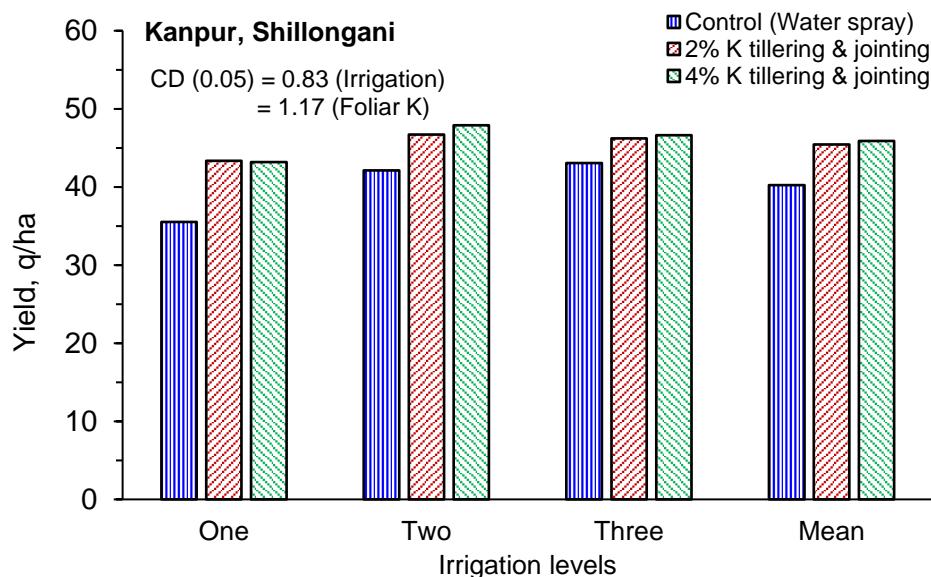

Fig. 37. Wheat productivity under irrigation levels and foliar K application in NEPZ

In NEPZ, this experiment was conducted at two locations (Kanpur and Shillongani). There was significant effects of irrigation levels and foliar application of K on the grain yield (Fig. 37). Significantly higher grain yield (45.58 q/ha) was achieved by application of irrigation at crown root initiation and flowering stage over single irrigation at CRI stage. Foliar application of 4% K resulted in significantly higher yield (45.90 q/ha) over spraying of water only although it was at par to foliar application of 2% K.

In CZ, this trial was conducted at four locations (Dhanduka, Durgapura, Jabalpur, Vijapur) and pooled analysis of data (Fig. 38) revealed that maximum and significantly higher grain yield (38.37 q/ha) was produced in three number of irrigations (at CRI, late jointing and milking stage) and foliar application of K treatment 4 % K application at tillering and jointing produce significantly higher yield (35.30 q/ha) than 2 % K application at tillering (40-45) and jointing (60-65 DAS) (33.98 q/ha) and control (31.30 q/ha).

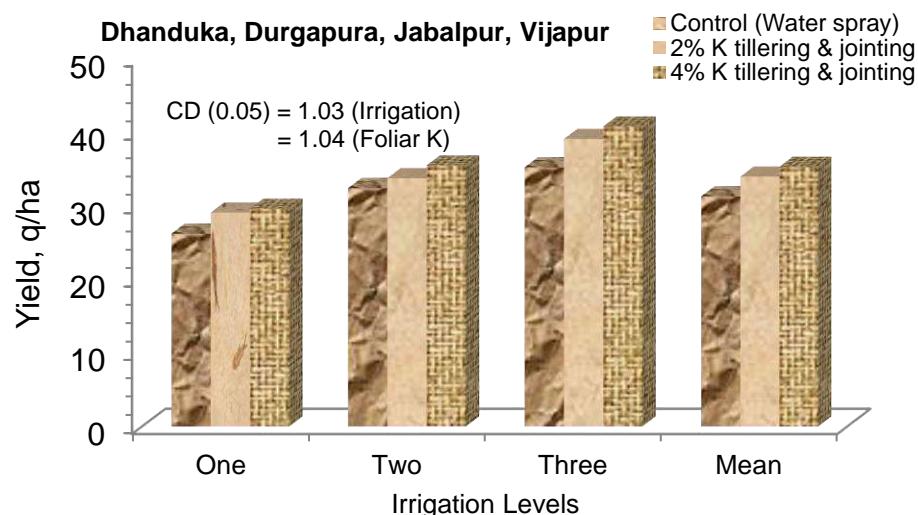

Fig. 38. Wheat productivity under irrigation levels and foliar K application in CZ

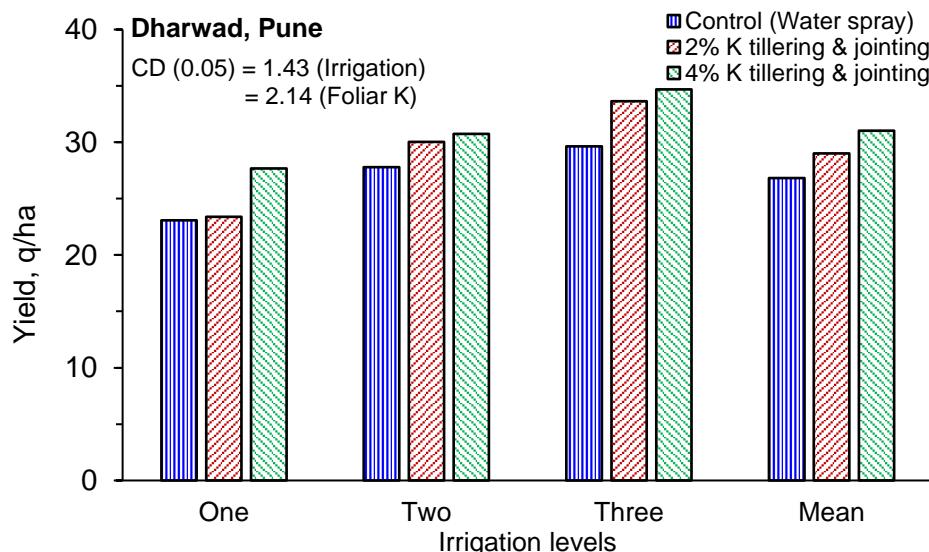

Fig. 39. Wheat productivity under irrigation levels and foliar K application in PZ

In PZ, this experiment was conducted at Dharwad and Pune centres. The results of pooled data given in Fig. 39 indicated that irrigation levels made significant effect on grain yield and it was maximum as 34.70 q/ha under three irrigation with 4% K foliar application. The foliar application of 4% K gave the maximum mean grain yield of 31.04 q/ha which was 15.69% higher than control treatment.

#### **SPL-9: Agronomic interventions for quality enhancement in wheat varieties across different wheat growing zones**

In NWPZ, this trial was conducted with an objective to enhance quality of wheat varieties by foliar spray of sulphur (S), nitrogen (N), zinc (Zn), potash (K) and their combinations at four centres (Gurdaspur, Hisar, Ludhiana and Pantnagar). The pooled analysis of data presented in Fig. 40 revealed that the maximum mean grain yield (49.59 q/ha) was produced under the treatment of S+N+Zn+K (all nutrients spray) which remained statistically at par with all treatments except no foliar application of nutrients (control). Among varieties, DBW187 produced the maximum and significantly higher grain yield (53.41 q/ha) than all the other varieties. Maximum and significantly higher iron (Fe) content (37.26 ppm) was recorded in PBW 1 Zn genotype; however, there was no significant difference among foliar fertilization treatments. The maximum and significantly higher zinc content (39.68 ppm) was found in HD 3226 genotype followed by in PBW 1 Zn genotype (38.28 ppm) and in treatment of Zn foliar fertilization (41.76 ppm) followed by the treatment of S+N+Zn+K (40.86 ppm). Maximum and significantly higher protein content (14.3%) and maximum hectolitre weight (74.81 kg) was recorded in genotype HD 3226 indicating better quality and density (heaviness) of grains.

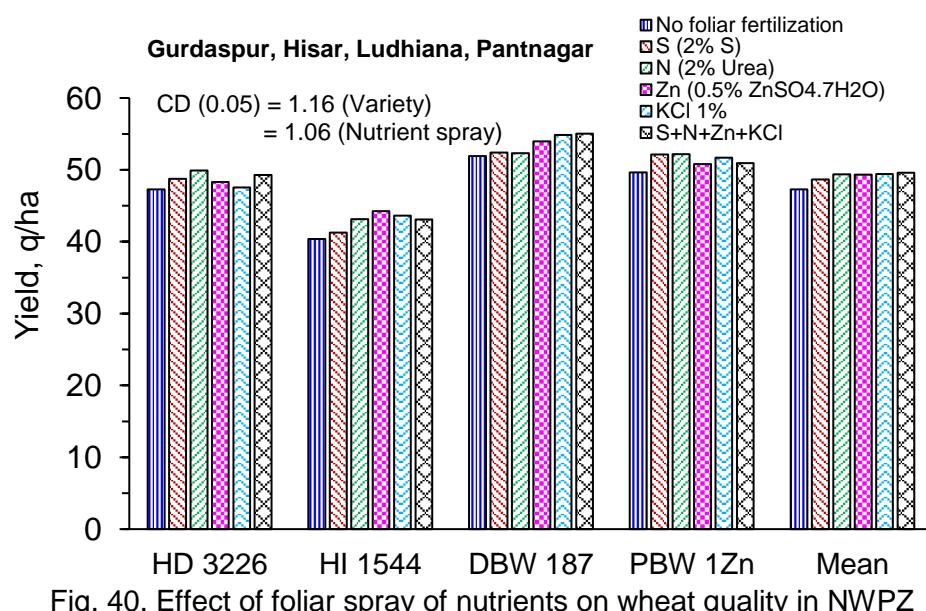

Fig. 40. Effect of foliar spray of nutrients on wheat quality in NWPZ

In NEPZ, this experiment was conducted at Kanpur center only. There was significant effects of foliar spray of S, N, Zn, K and their combinations on the grain yield, whereas different

genotypes were found at par (Fig. 41). The highest grain yield (38.88 q/ha) and grains per earhead were observed in HI 1544 genotype when Zn (0.5% ZnSO<sub>4</sub>.7H<sub>2</sub>O) was sprayed. Significantly higher Fe content was observed through foliar spray of S+N+Zn+KCl, whereas foliar spray of Zn (0.5% ZnSO<sub>4</sub>.7H<sub>2</sub>O) resulted in significantly higher Zn content.

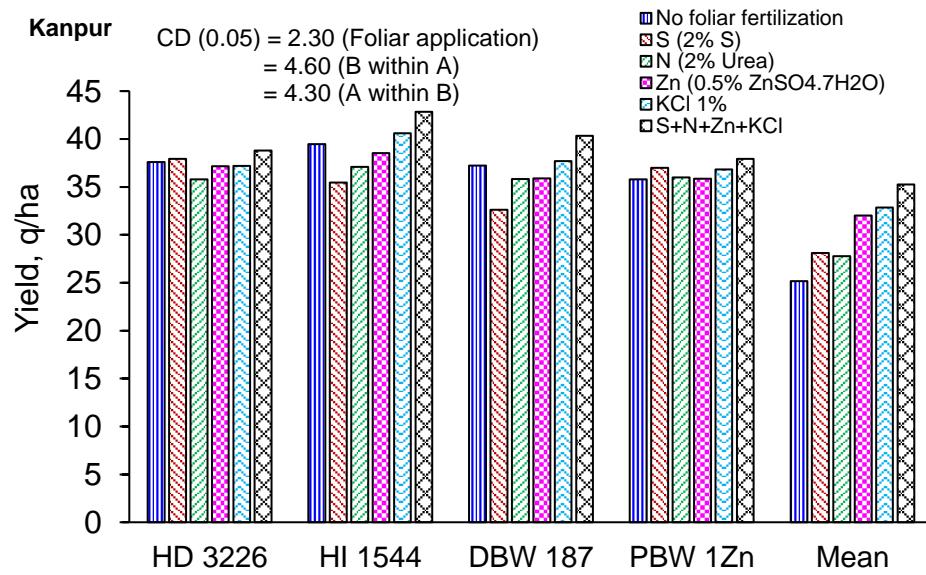

Fig. 41. Effect of foliar spray of nutrients on wheat quality in NEPZ

In CZ, this trial was conducted only at Vijapur centre with four genotypes (HD 3226, HI 1544, DBW 187, and PBW 1 Zn) and six combinations of foliar fertilization. The data (Fig. 42) revealed that maximum grain yield (45.21 q/ha) was produced under the treatment of N (2% urea spray) though statistically all treatments remained at par.

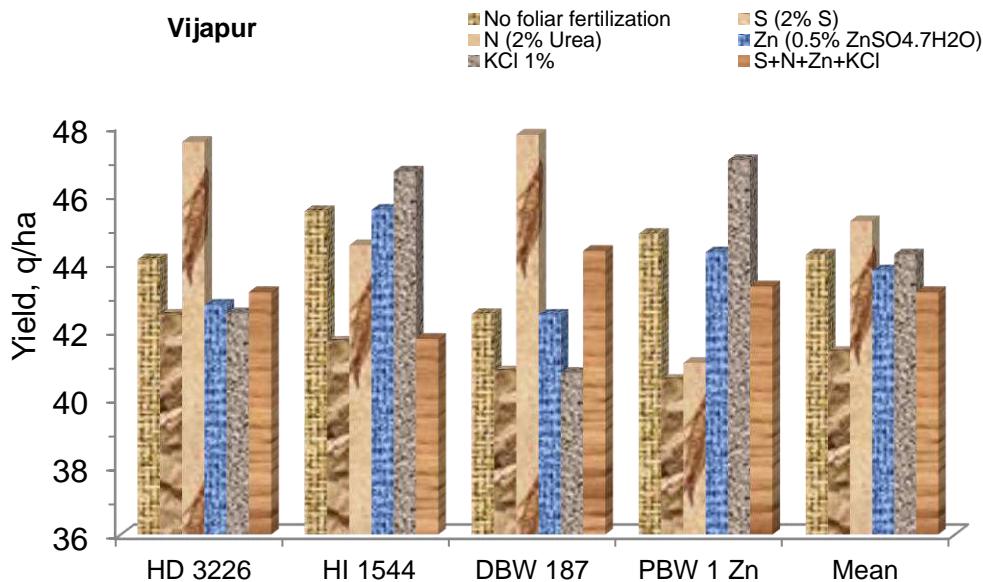

Fig. 42. Effect of foliar spray of nutrients on wheat quality in CZ

### SPL- 10: Effect of NPK solubilizing microbial (Rhizosphere) consortium on productivity of wheat

In NHZ, this experiment was conducted at Shimla centre only. Application of recommended dose of NPK with and without seed treatment recorded significantly higher grain yield compared to all the lower doses of NPK applied with and without seed treatment (Fig. 43). The lowest grain yield (17.85 q/ha) was recorded in control plots (no fertilizer and no seed treatment). The seed treatment did not cause any significant yield improvement except at 75% Rec NPK rates.

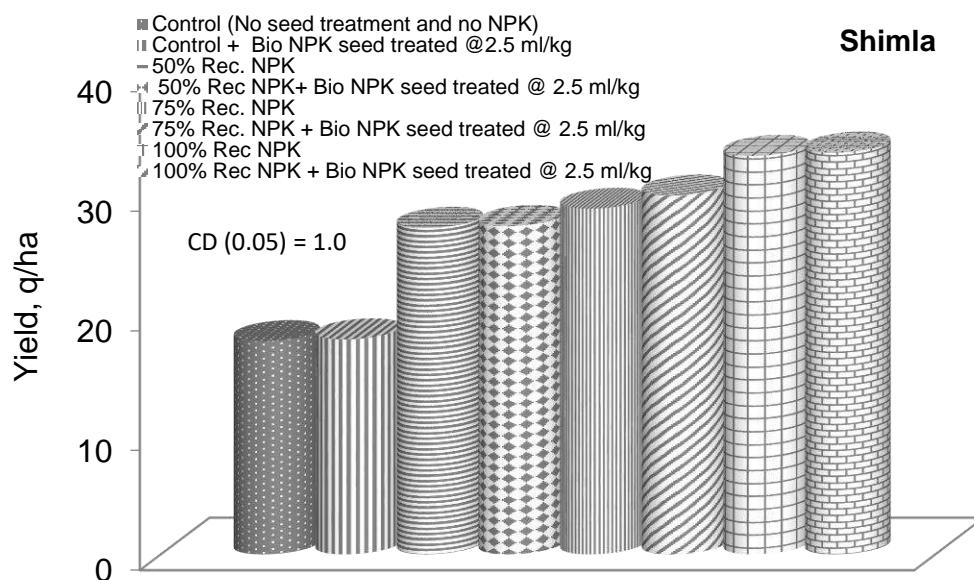

Fig. 43. Wheat productivity under NPK solubilizing microbial consortium in NHZ

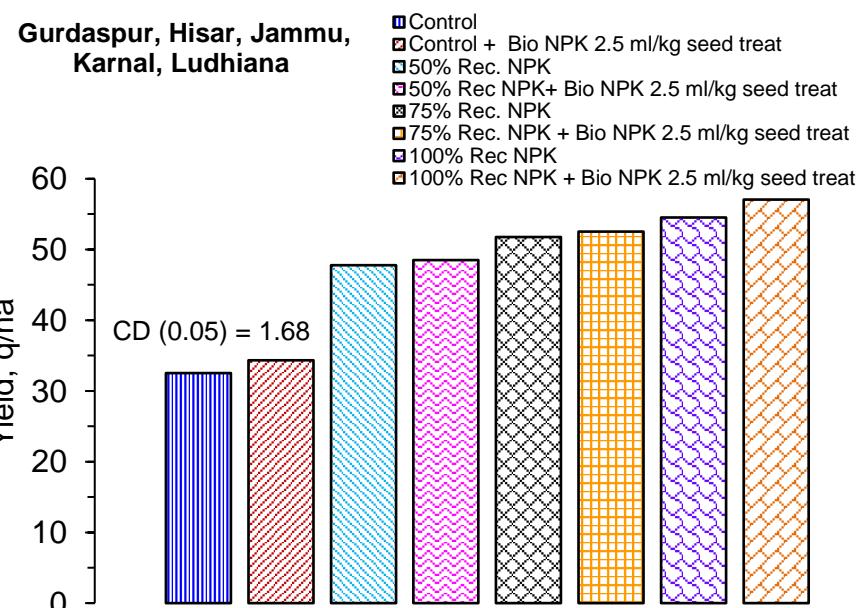

Fig. 44. Wheat productivity under NPK solubilizing microbial consortium in NWPZ

In NWPZ, this experiment was conducted at five centres viz., Gurdaspur, Hisar, Jammu, Karnal and Ludhiana. The pooled data of all the five centres presented in Fig. 44 showed that the maximum grain yield of 57.05 q/ha was recorded with 100% NPK + seed treatment with Bio NPK @2.5 ml/kg followed by 54.50 q/ha with 100% NPK. The seed treatment with Bio NPK @2.5 ml/kg brought about significant improvement in grain yield only under control and with 100% NPK treatments.

In NEPZ, this experiment was conducted at three locations (IARI PUSA, RPCAU PUSA and Varanasi). The maximum grain yield (42.6 q/ha) was obtained under 100% recommended NPK + seed treatment with Bio NPK @ 2.5 ml/kg and was significantly superior to all other treatments except 100% recommended NPK (Fig. 45). The yield gain in 100% recommended NPK + seed treatment with Bio NPK @ 2.5 ml/kg treatment over control was 91.9%.

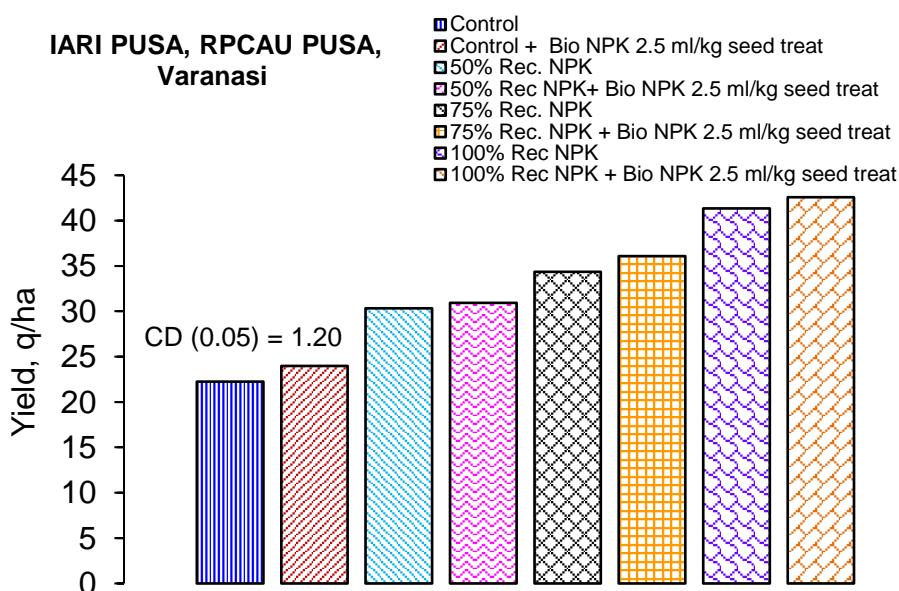

Fig. 45. Wheat productivity under NPK solubilizing microbial consortium in NEPZ

In CZ, this trial was conducted at three locations (Indore, Junagadh, Vijapur) and the perusal of pooled data (Fig. 46) revealed that maximum and significantly higher grain yield (54.87 q/ha) was produced by the treatment 100% Rec. NPK + seed treatment with Bio NPK @2.5ml/kg followed by 100% Rec. NPK (54.25 q/ha) which remained statistically at par among themselves.

In PZ, this experiment was conducted at Pune centre. The results presented in Fig. 47 revealed that the maximum grain yield was found as 55.77 q/ha when 100% NPK + seed treatment with Bio NPK @2.5 ml/kg was used. The application of 100% NPK resulted into a grain yield of 53.78 q/ha. Based on the entire results, it can be stated that effect of seed treatment on grain yield was significant under control and 100% NPK treatments only.

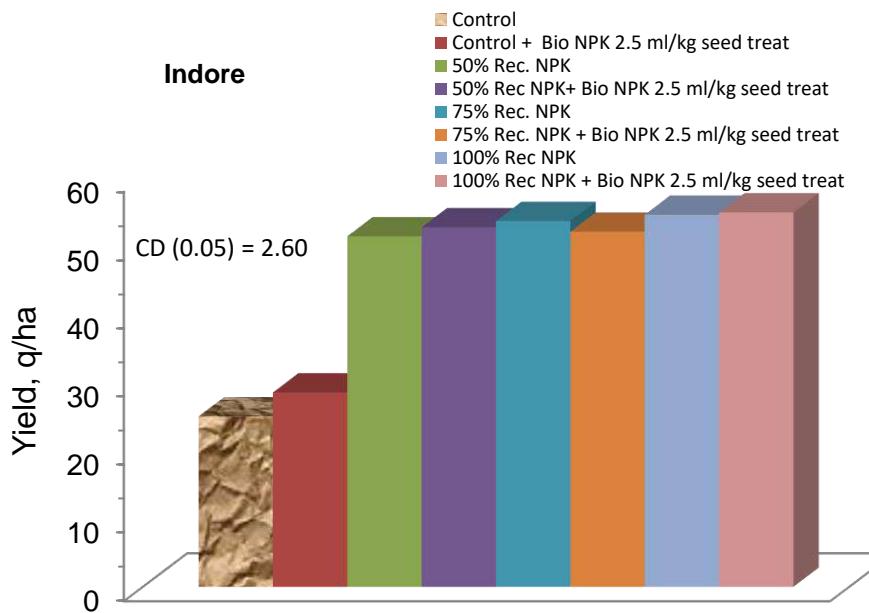

Fig. 46. Wheat productivity under NPK solubilizing microbial consortium in CZ

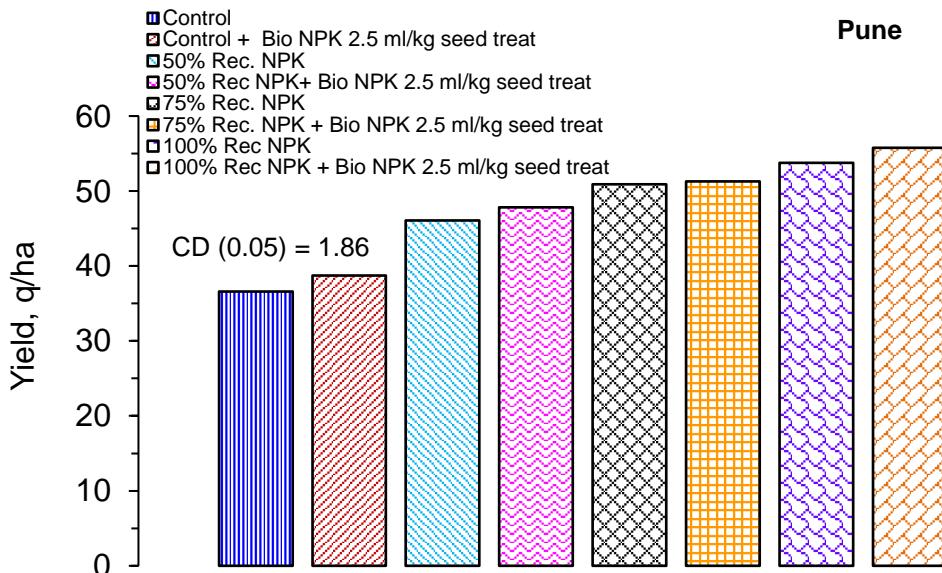

Fig. 47. Wheat productivity under NPK solubilizing microbial consortium in PZ

#### SPL-11: Improving wheat productivity through silica foliar application

In PZ, this experiment was conducted at Dharwad centre with an objective of reducing moisture stress and to enhance the yield potential of wheat by using silica sprays. The results given in Fig. 48 suggested that either irrigation levels or foliar application could not improve the grain yield significantly. The maximum grain yield of 32.68 q/ha was observed under three irrigation with foliar application of 2 ml KSi/litre of water. The mean grain yield across irrigation levels and foliar silica application was found in the range of 27.66-30.28 and 27.39-31.09 q/ha, respectively.

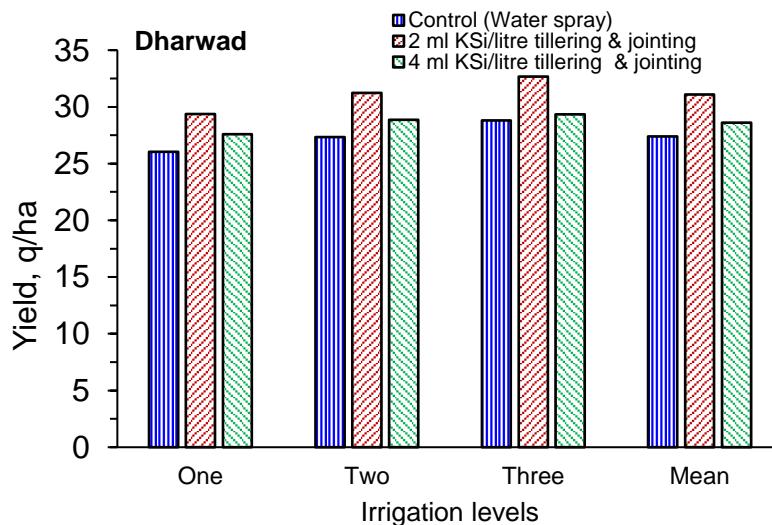

Fig. 48. Effect of Silica foliar (KSi) application on wheat productivity in PZ

#### **SPL-12: Improving wheat productivity through nutrients solubilizing microbial (Rhizosphere) consortium**

In PZ, this experiment was conducted at Dharwad centre with the aim of maximizing wheat productivity by nutrients solubilizing microbial (rhizosphere) consortium. The results shown in Fig. 49 revealed that application of 75% recommended NPK + seed treatment with microbial consortium @4 ml/kg seed + 4% microbial consortium spray at 20-25 DAS gave the maximum grain yield of 38.73 q/ha. It was statistically similar to grain yield under the application of seed treatment either @2 ml/kg or 4 ml/kg with 100% NPK. The grain yield was significantly improved when seed treatment @2 ml/kg either with 50% or 75% NPK was changed to seed treatment @4 ml/kg + spray of 4% microbial consortium with 50 or 75% NPK.

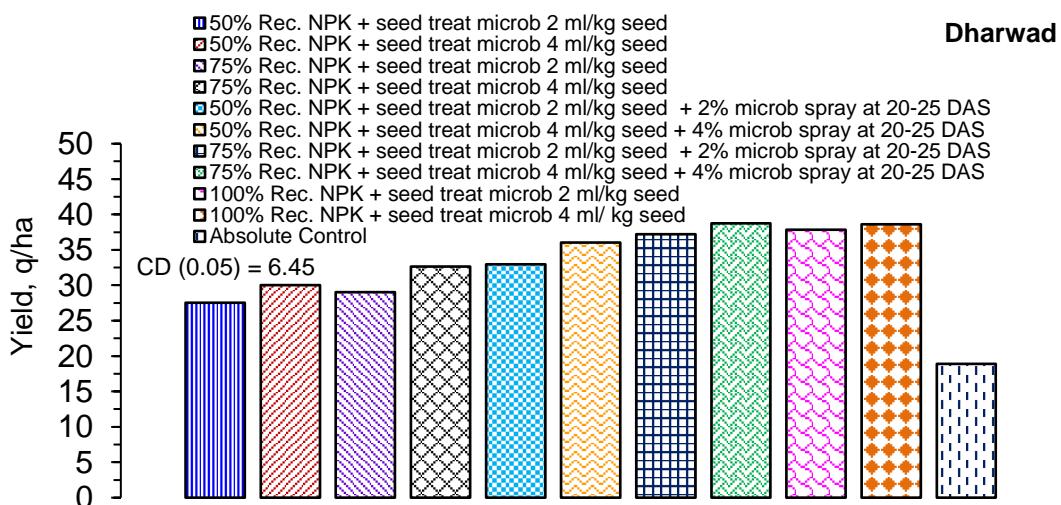

Fig. 49. Wheat productivity under N, P and K solubilizing microbial consortium in PZ

## **Northern Hill Zone**

The Northern Hills Zone represents Himachal Pradesh, parts of Jammu & Kashmir, and Uttarakhand. The five centres namely Almora, Bajaura, Khudwani, Malan and Shimla are actively engaged in wheat research under All India Coordinated Wheat and Barley Improvement Project. The data on meteorological parameters received from centres have been reported in Annexure II. The rainfall was well distributed at all the locations; the highest rainfall of 445.7 mm was recorded at Shimla during the crop growing period followed by 346.9 mm at Bajaura, 342.2 mm at Malan, 65.4 mm at Almora and 52.3 mm at Khudwani. The minimum and maximum temperatures were -2.9 °C and 34.0 °C at Almora, -2.3 °C and 31.7 °C at Bajaura, -4.2 °C and 23.5 °C at Khudwani, 5.5 °C and 33.9 °C at Malan, and -0.6 °C and 26.9 °C at Shimla, respectively. The soil data received from three centres (Almora, Bajaura and Malan) are presented in Annexure III. The texture of soil at Bajaura was silty loam. The organic carbon content of Almora, Bajaura and Malan centres was 0.8, 0.57 and 0.79 per cent, respectively, with low to medium in nitrogen, medium to high in phosphorus and potash contents.

The performance of test genotypes was evaluated under restricted irrigation conditions at different locations and the results are presented here under;

### **Restricted Irrigation**

The restricted irrigation trial was conducted with the objective to evaluate the *aestivum* test entry namely VL 2041 against four checks varieties HPW 349, VL 907, HS 562, HF 507 at five locations (Almora, Bajaura, Khudwani, Malan and Shimla). For pooled analysis, Khudwani centre data were not included due to incomplete data and rest four centre data were taken into account. The trial was laid out in a split plot design with number of irrigations in main and genotypes in sub plots with three replications. The sowing was done using the normalized (adjusted considering 1000 grains weight as 38 g) seed rate of 100 kg/ha at a row-to-row spacing of 20 cm. Nitrogen, phosphorus and potash (90:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O) were applied as full basal in I1 treatment i.e. no irrigation, whereas 1/3<sup>rd</sup> N and full phosphorus and potash were applied as basal at sowing and remaining 2/3<sup>rd</sup> nitrogen at first irrigation i.e. at 20-25 days after sowing in I2 and I3 treatments.

The centrewise yield and zonal mean yield are presented in Table 1.1. The pooled analysis is presented in Table 1.2 and the centre wise data are in Annexure-I in Tables 1.2.1 to 1.2.5. The perusal of data in Table 1.2 indicates that increasing the irrigation level significantly increased the grain yield and earhead/m<sup>2</sup>. Maximum and significantly higher grain yield (41.16 q/ha) was obtained with two irrigations as compared with zero and one irrigations levels. Increasing

irrigation level enhanced the grain yield mainly due to significant increase in earhead/m<sup>2</sup>. All the check varieties were significantly superior to test entry VL 2041. Among check varieties, HS 562 (C) produced significantly higher yield (40.48 q/ha) on mean basis. Irrigation level and genotypes interaction was non-significant for grain yield and yield attributes. Check variety HS 562 ranked first at all irrigation levels for grain yield. The centre wise data are presented in Tables 1.2.1 to 1.2.5 in Annexure-I.

## **North Western Plains Zone**

The North Western Plains Zone (NWPZ) is the most important wheat growing zone of the country. In this zone, the areas covered are the states of Haryana, Punjab, Delhi, western UP, part of Rajasthan and Jammu area of J&K. Ten centres in this zone namely BISA Ludhiana, Delhi, Gurdaspur, Gwalior, Hisar, Jammu, Karnal, Ludhiana, Pantnagar and Sriganganagar are actively engaged in wheat research activities under All India Coordinated Wheat and Barley Improvement Project (AICW&BIP). The data on soil and various meteorological parameters for various centres are given in Annexure-II and Annexure-III, respectively. Soils of this zone are sandy loam to clay loam. The soil organic carbon at various locations varied from 0.21% at Sriganganagar to 0.72% at Pantnagar. Soils of this zone are low in available nitrogen, medium to high in available phosphorus and available potash. The maximum rainfall was received at Pantnagar (584.4 mm), followed by Delhi (377.4 mm), Jammu (354.0 mm), Gurdaspur (323.9 mm), Karnal (209.2 mm), Ludhiana (194.5 mm), Gwalior (127.4 mm), Sriganganagar (79.6 mm) and the lowest amount of rain (78.0 mm) during the wheat crop season 2021-22 was received at Hisar. The maximum and minimum temperatures at different locations were 43.3 and 4.4 °C at Delhi, 39.3 and 3.9 °C at Gurdaspur, 43.9 and 4.7 °C at Gwalior, 41.5 and 3.3 °C at Hisar, 39.6 and 2.9 °C at Jammu, 40.6 and 4.9 °C at Karnal, 39.9 and 4.9 °C at Ludhiana, 38.2 and 4.2 °C at Pantnagar, 44.1 and 4.7 °C at Sriganganagar, respectively. In this zone, three coordinated trials were conducted to evaluate second year AVT genotypes for different growing conditions at various locations.

### **EVALUATION UNDER DIFFERENT GROWING CONDITIONS**

The performance of test genotypes was evaluated under different sowing conditions, restricted irrigation conditions and at high fertility condition at different locations and the results are summarized here under;

#### **Irrigated Timely Sown**

Two test entry, HD3406 and PBW826 were evaluated against four checks viz. HD2967(c), HD3086(c), DBW187(c) and DBW222(c) at nine locations (Delhi, Gurdaspur, Gwalior, Hisar, Jammu, Karnal, Ludhiana, Pantnagar and Sriganganagar) under timely (5<sup>th</sup> November to 11<sup>th</sup> November) and late (10<sup>th</sup> December to 16<sup>th</sup> December) sown conditions. Karnal and Pantnagar centre's data were not considered in pooled analysis due to low mean yield (<50 q/ha under timely sown conditions). The trial was conducted in split plot design with dates of sowing in main plots and genotypes in sub plots. The sowing was done using the normalized (adjusted considering 1000 grains weight of 38 g) seed rate of 100 kg/ha at a row-to-row spacing of 20 cm. Nitrogen was applied in three splits (1/3<sup>rd</sup> at sowing, 1/3<sup>rd</sup> at first irrigation i.e. at 20-25 days

after sowing and 1/3<sup>rd</sup> at second irrigation i.e. 40-45 days after sowing), whereas full phosphorus and potash was applied as basal.

The centrewise yield and zonal mean yield are given in Table 2.1. The pooled data are presented in Table 2.2 and the centre wise data are in Annexure-I as Tables 2.2.1 to 2.2.9. The significant effect of sowing time and genotypes was observed on yield and yield attributes. The interaction effect was significant for 1000 grains weight only. Timely sowing gave higher productivity of all genotypes compared to late sowing and on an average, yield declined by 21.5% when sowing was delayed from timely to late sowing circumstances. The yield decline was due to significant reduction in effective tillering, grains/earhead and thousand grains weight under late sown conditions over timely sown conditions. On an average basis, the test genotype PBW 826 was top yielder (53.94 q/ha) and recorded significantly higher grain yield compared to other test entry HD3406 and checks. The second test entry HD3406 remained on fourth rank based on pooled average yield basis. The second highest yielder was the check entry DBW 222 with an average yield of 52.12 q/ha. Test genotype PBW 826 recorded 3.4, 6.9, 8.8, 9.3 and 11.6% higher grain yield than DBW 222(c), DBW 187(c), HD 3406, HD 2967(c) and HD 3086(c), respectively. Test entry PBW 826 had the highest effective tillering (370 earheads/sq.m) and the boldest grains (38.99 g thousand grains weight). The highest grains/earhead were observed in check variety DBW 222 (40.94 grains/earhead) followed by HD 2967 (40.18 grains/earhead). The perusal of centre wise results indicated that the yield decline was the highest at Srigananagar (40.2.7%) followed by Hisar (27.7%) and the lowest at Gurdaspur (1.0%) when sowing was delayed from second week of November to third week of December.

### **Restricted Irrigation**

The restricted irrigation trial was conducted with the objective to evaluate the three *aestivum* test entries namely HI1653, HI1654 and HD3369 against six checks varieties HD 3043, NIAW 3170, DBW 296, PBW 644, HI 1628 and HUW 838 at nine locations (Delhi, Gurdaspur, Gwalior, Hisar, Jammu, Karnal, Ludhiana, Pantnagar and Srigananagar). For pooled analysis, Karnal centre data were not included due to low mean yield and rest eight centre data were pooled for statistical analysis. The trial was laid out in a split plot design with number of irrigations in main and genotypes in sub plots with three replications. The sowing was done using the normalized (adjusted considering 1000 grains weight as 38 g) seed rate of 100 kg/ha at a row-to-row spacing of 20 cm. Nitrogen, phosphorus and potash (90:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O) were applied as full basal in I<sub>1</sub> treatment i.e. no irrigation, whereas 1/3<sup>rd</sup> N and full phosphorus and potash were applied as basal at sowing and remaining 2/3<sup>rd</sup> nitrogen at first irrigation i. e. at 20-25 days after sowing in I<sub>2</sub> and I<sub>3</sub> treatments.

Centres: Delhi, Gurdaspur, Gwalior, Hisar, Jammu, Ludhiana and Srigananagar

The centrewise yield and zonal mean yield are presented in Table 2.3. The perusal of pooled data in Table 2.4 indicates that increasing the irrigation level significantly increased the grain yield, earhead/m<sup>2</sup> and thousand grain weight. The maximum and significantly higher grain yield (47.74 q/ha) was obtained with two irrigations as compared with zero and one irrigations levels. Increasing irrigation level enhanced the grain yield mainly due to significant increase in earhead/m<sup>2</sup> and thousand grain weight. The check variety HUW 838(c) produced significantly higher mean grain yield (45.27 q/ha) as compared to all test entries and other checks except test entry HI1654 (44.65q/ha) which was at par.

Centres: Delhi, Gurdaspur, Gwalior, Hisar, Jammu, Ludhiana, Panthnagar and Sriganganagar

Among test entries, HI1654 (44.65q/ha), HI1653 (44.55 q/ha) and HD3369 (44.19 q/ha) ranked second, third and fifth, respectively, in yield on mean basis. Irrigation level and genotypes interaction was significant for grain yield. Test entry HI1653 ranked first in producing the boldest grains (41.22 g thousand grains weight) and test entry HI1654 produced the highest number of grains per earhead (35.94); however, the maximum earhead density (367/sqm) was reported in

check genotype NIAW 3170(c). The centre wise data are presented in Tables 2.4.1 to 2.4.9 in Annexure-I.

### **High Yield Potential Trial**

This experiment was conducted to maximise the wheat yield with target yield of 8 t/ha by using higher level of inorganic and organic fertilisers combined with spraying of growth retardant to control lodging. Experiment consists of two nutrient management treatments viz. recommended doses of fertilizers (RDF) and 150% RDF + 15 t FYM/ha + two sprays as tank mix-Chlormequat chloride (Lihocin) @ 0.2% + tebuconazole (Folicur 430 SC) @ 0.1% of commercial product dose at first node and flag leaf stage, in main plots and nine high yielding wheat genotypes {DBW370, PBW872, DBW371, DBW372, DBW187(c), DBW303(c), DBW327(c), DBW332(c) and HD3086(c)} in sub plots having three replications. The experiment was conducted at six centres namely Gurdaspur, Hisar, Karnal, Ludhiana, BISA Ladowal and Pantnagar. The sowing was done using normalized seed rate of 100 kg/ha (adjusted considering 1000 grains weight as 38 g). Irrigation and weed control measures were applied as per recommended package of practices for the concerned zone.

The centrewise yield and zonal mean yield are shown in Table 2.5. For pooled analysis, the data of Hisar and Karnal centres only were considered and rest four centre (Gurdaspur, Ludhiana, BISA Ladowal and Pantnagar) were not considered for pooled analysis due to low mean yield (<65 q/ha) at highest fertility level. The pooled analysed data of two centres presented in Table 2.6 showed significant effect of fertiliser application on grain yield and yield attributes. The grain yield enhanced significantly with increased fertiliser doses. Addition of 150% RDF and two sprays of growth retardants increased the grain yield (66.17 q/ha) significantly as compared to RDF (58.63 q/ha). This increase was to the tune of 12.9% over RDF. This showed that growth retardant in combination with fungicide tebuconazole was more effective for control of lodging and enhancing the grain yield. The application of growth retardant significantly increased the earheads/sqm and grains/earhead; however, it reduced the plant height as compared to recommended fertiliser application. This confirms the hypothesis that growth retardant reduced the height and at the same time produced more tillers and biomass that resulted in increased grain yield. Test entry PBW872 ranked first on mean yield basis with yield of 67.73 q/ha, which was significantly higher than other genotypes. This genotype also yielded 70.85 q/ha under 150% RDF + 15 t FYM/ha + two sprays of growth regulators at first node and flag leaf stage which was higher than other varieties. High yield in PBW872 was due to its bolder grains (49.45 g thousand grains weight). The second and third ranked high yielding genotypes were DBW371 (65.28 q/ha) and DBW327(c) (65.06 q/ha), respectively on mean yield basis. Centre wise data are presented in Annexure-I in Tables 2.6.1 to 2.6.6.

## **North Eastern Plains Zone**

The North Eastern Plains Zone (NEPZ) is the second most important wheat growing zone of the country consisting of Assam, Bihar, Jharkhand, Orissa, eastern parts of UP and West Bengal. In all eleven centres namely Ayodhya, Burdwan, Coochbehar, IARI Pusa Bihar, Kalyani, Kanpur, Ranchi, RPCAU Pusa, RAU Sabour, Shillongani and Varanasi are actively involved in coordinated research activities. Soils of this zone are sandy to clay loam having organic carbon contents varying from 0.39 per cent at Kanpur to 1.2 per cent at Shillongani. The soils of this zone are low in available nitrogen, medium in available phosphorus and potash. Wheat production and productivity in this zone are more dependent on weather conditions during the crop season. The temperature is an important factor affecting the wheat productivity. Rainfall received varied from 56.3 mm at Varanasi to 371.7 mm at IARI Pusa Bihar during the wheat season starting from November 2021 to April, 2022. The rainfall (November to April) received in decreasing order was Shillongani (370.4 mm) followed by Sabour (266.1 mm), Burdwan (229 mm), Kanpur (208.7 mm), Ranchi (189.8 mm), Kalyani (128.04 mm), Coochbehar (73.2 mm), Ayodhya (67.8) and Varanasi (56.3 mm). The maximum and minimum temperatures at different locations from November to April were 40.7°C and 5.7 °C at Ayodhya, 39.9 °C and 11.3 °C at Burdwan, 34.3 °C and 9.2 °C at Coochbehar, 37.9°C and 7.6 °C at IARI Pusa Bihar, 39.1°C and 9.9°C at Kalyani, 42.2°C and 7.1°C at Kanpur, 39.2°C and 3.6°C at Ranchi, 40.0°C and 8.7°C at Sabour, 34.2°C and 7.6°C at Shillongani and 40.9 °C and 6.7 °C at Varanasi, respectively.

### **EVALUATION UNDER DIFFERENT GROWING CONDITIONS**

The performance of test genotypes was evaluated under irrigated timely sown conditions at different locations and the results are summarized here under;

#### **Irrigated Timely Sown**

Three test entries HD 3411, PBW 826 and HD 3406 were evaluated against five checks viz. HD 2967(c), HD 3086 (c), HD 3249 (c), HD 2733 (c) and DBW 187(c) at nine locations (Ayodhya, Coochbehar, Kalyani, Kanpur, Ranchi, RPCAU Pusa, Sabour, Shillongani and Varanasi) under timely (5<sup>th</sup> November to 11<sup>th</sup> November) and late (10<sup>th</sup> December to 16<sup>th</sup> December) sown conditions. The data of Ayodhya, Kalyani, Kanpur, RPCAU Pusa and Sabour, were not considered in pooled analysis due to low mean yield (<45 q/ha under timely sown conditions). The trial was conducted in split plot design with dates of sowing in main plots and genotypes in sub plots. The sowing was done using the normalized (adjusted considering 1000 grains weight of 38 g) seed rate of 100 kg/ha at a row-to-row spacing of 20 cm. Nitrogen was applied in three splits (1/3<sup>rd</sup> at sowing, 1/3<sup>rd</sup> at first irrigation i.e. at 20-25

days after sowing and 1/3<sup>rd</sup> at second irrigation i.e. 40-45 days after sowing), whereas full phosphorus and potash was applied as basal.

The centrewise yield and zonal mean yield are shown in Table 3.1. The pooled data are presented in Table 3.2 and the centre wise data are in Annexure-I as Tables 3.2.1 to 3.2.9. Timely sowing registered higher yield of all genotypes compared to late sowing and on mean basis, yield declined by 10.03% when sowing was delayed from timely to late sowing condition. The yield decline was due to significant reduction in 1000 grains weight under late sown condition as compared to timely sown condition. On mean basis, the check variety HD 2733 was the highest yielder ( $50.45 \text{ q ha}^{-1}$ ) and recorded significantly higher grain yield compared to all checks except DBW 187 and one test entry PBW 826. The check variety HD 2733 also recorded maximum effective tillers (331 earheads/sq.m). The maximum grains/earhead were observed in test entry HD 3406 (40.57 grains/earhead) followed by PBW 826 (39.37 grains/earhead). The check variety DBW 187 produced the boldest grains having mean 1000 grains weight of 45.73 g.

### **Irrigated Late Sown**

Three test entries DBW 316, PBW 833 and PBW 835 were evaluated against four checks viz. HI1563(c), HI1621(c), HD3118(c) and DBW 107(c) at nine locations (Ayodhya, Coochbehar, Kalyani, Kanpur, Ranchi, RPCAU Pusa, Sabour, Shillongani and Varanasi) under late (10<sup>th</sup> December to 16<sup>th</sup> December) and very late (1<sup>st</sup> Jan. to 7<sup>th</sup> Jan.) sown conditions. The data of Kanpur and RPCAU Pusa were not considered in pooled analysis due to low mean yield (<35 q/ha under late sown conditions). The trial was conducted in split plot design with dates of sowing in main plots and genotypes in sub plots. The sowing was done using the normalized (adjusted considering 1000 grains weight of 38 g) seed rate of 125 kg/ha at a row-to-row spacing of 20 cm. Nitrogen was applied in three splits (1/3<sup>rd</sup> at sowing, 1/3<sup>rd</sup> at first irrigation i.e. at 20-25 days after sowing and 1/3<sup>rd</sup> at second irrigation i.e. 40-45 days after sowing), whereas full phosphorus and potash was applied as basal.

The centrewise yield and zonal mean yield are shown in Table 3.3. The pooled data are presented in Table 3.4 and the centre wise data are in Annexure-I as Tables 3.4.1 to 3.4.9. Late sowing registered higher yield of all genotypes compared to very late sowing and on mean basis, yield declined by 25.37% when sowing was delayed from late to very late sowing condition. The yield decline was due to significant reduction in earheads/sq.m, grains/earhead and 1000 grains weight under very late sown condition as compared to late sown condition. On mean basis, the test entry PBW 835 was the highest yielder (36.07 q ha<sup>-1</sup>) and was at par with all other test entries and checks. The check variety HI 1563 recorded the maximum effective tillers (332 earheads/sq.m). The maximum grains/earhead were observed in check variety DBW 107(30.88 grains/earhead) followed by PBW 833 (30.45 grains/earhead). The test entry DBW 316 produced the boldest grains having mean 1000 grains weight of 38.10 g.

## **Central Zone**

In central zone, ten centres namely Bilaspur, Dhanduka, Durgapura, Gwalior, Indore, Jabalpur, Junagadh, Powarkheda, Udaipur and Vijapur are actively involved in the coordinated wheat programme of Resource Management during the year 2021-22. The data on soil and various meteorological parameters have been reported under Annexure II and Annexure III, respectively. The soils in this zone vary from sandy loam (Vijapur) to black cotton soils (Dhanduka). Soil was sandy clay loam at Bilaspur, loamy sand at Durgapura, Vertisols at Indore and Jabalpur, medium black at Junagadh and clay loam at Udaipur. Soils were neutral to slightly alkaline in reaction (pH: 7.2 to 8.2). Soils of all the centres were low to medium in organic carbon (0.24-0.93 per cent), low to medium available N (157-301 kg/ha), low to high phosphorus (5.46-42.89 kg/ha) and high in potassium (232-432 kg/ha) at different locations. The rainfall in this zone during the wheat growing season 2021-22 was recorded as 13.29 mm at Bilaspur, 24.9 mm at Dhanduka, 83.1 mm at Durgapura, 115.8 mm at Indore, 120.8 mm at Jabalpur, 77.6 mm at Junagadh, 52.2 mm at Powarkheda, 20.5 mm at Bilaspur, 220.8 mm at Udaipur and 31.6 mm at Vijapur . The average maximum and minimum temperatures were 29.3 and 12.8 °C at Bilaspur, 32.3 and 17.0 °C at Dhanduka, 28.7 and 14.4 °C at Durgapura, 30.2 and 14.7 °C at Indore, 29.6 and 13.1 °C at Jabalpur, 33.1 and 17.5 °C at Junagadh, 32.6 and 11.7 °C at Powarkheda, 30.5 and 11.3 °C at Udaipur and 31.8 and 13.1 °C at Vijapur.

In this zone, four coordinated trials were conducted viz. performance of new wheat genotypes at different dates of sowing under irrigated (timely & late, late & very late), restricted irrigation conditions and high yield potential trial.

### **EVALUATION OF GENOTYPES UNDER DIFFERENT GROWING CONDITIONS**

#### **Irrigated Timely Sown**

Three test entries (HI 1650, MACS 6768 and MP 3535) were evaluated against four check varieties (HI 1544, GW 322, GW 513 and HI 1636) under timely and late sown conditions. The trial was conducted at eight centres (Bilaspur, Durgapura, Indore, Jabalpur, Junagadh, Powarkheda, Udaipur, Vijapur) in split plot design with date of sowing in main plots and genotypes in sub plots. The sowing was done using the normalized (adjusted considering 1000 grains weight as 38 g) seed rate of 100 kg/ha with row to row spacing of 20 cm. Recommended rate of nitrogen, phosphorus and potash (120:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O) were applied. Full dose of phosphorus and potash and 1/3<sup>rd</sup> N were applied as basal dose and remaining 2/3<sup>rd</sup> N was applied in two equal splits during first and second irrigations.

The centrewise yield and zonal mean are shown in Table 4.1. The pooled analysis of eight centres (Bilaspur, Durgapura, Indore, Jabalpur, Junagadh, Powarkheda, Udaipur and Vijapur) is presented in Table 4.2. The centre wise data are presented in Tables 4.2.1 to 4.2.8 of Annexure-I. The perusal of data in Table 4.2 revealed that the test entry MACS 6768 (48.08 q/ha) ranked 3<sup>rd</sup> which was significantly inferior than check variety HI 1544, which ranked 1<sup>st</sup> with significantly higher yield (50.43 q/ha). Test entry HI 1650 ranked fourth (47.77 q/ha) and MP 3535 ranked seventh (41.36 q/ha). On an average basis, there was significant increase in grain yield (11.2%) when crop was sown under timely sown conditions compared to late sown conditions. Higher number of grains per ear head was main reason for maximum yield of check variety HI 1544 as compared to other entry and check genotypes. Interactions between sowing time and genotypes were found significant for yield, earheads/m<sup>2</sup> and grains/earhead.

### **Irrigated Late Sown**

Test entry HD 3407 was evaluated against five check varieties (HD2932, HI1634, MP3336, HD2864, CG1029) under late and very late sown conditions. The trial was conducted at eight centres (Bilaspur, Durgapura, Indore, Jabalpur, Junagadh, Powarkheda, Udaipur, Vijapur) in split plot design with date of sowing in main plots and genotypes in sub plots. The sowing was done using the higher (adjusted considering 1000 grains weight as 38 g) seed rate of 125 kg/ha with a row to row spacing of 20 cm. Recommended rate of nitrogen, phosphorus and potash for late sown conditions (90:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O) were applied. Full dose of phosphorus and potash and 1/3<sup>rd</sup> N was applied as basal dose and remaining 2/3<sup>rd</sup> N was applied in two equal splits during first and second irrigations.

The centrewise yield and zonal mean are presented in Table 4.3. The pooled analysis of eight centres (Bilaspur, Gwalior, Indore, Jabalpur, Junagadh, Powarkheda, Udaipur and Vijapur) is presented in Table 4.4. The centre wise data are presented in Tables 4.4.1 to 4.4.8 of Annexure-I. The perusal of data in Table 4.4 revealed that the test entry HD 3407 (41.61 q/ha) ranked 3<sup>rd</sup> which is statistically at par with check varieties CG 1029 (42.09 q/ha) and HD 2864 (41.86 q/ha) which ranked first and second, respectively. On an average basis, there was significantly higher yield (33.31%) when crop sown under late sown conditions compared to very late sown conditions. The significantly higher thousand grain weight was the reason for maximum yield of check variety CG 1029 as compared to other entry and check varieties. Interaction between sowing time and genotypes was found significant for yield, earheads/m<sup>2</sup> and thousand grains weight.

### **Restricted Irrigation**

Four test entries [HI 1655, CG 1036, HI 8830 (d) and DDW 55 (d)] were evaluated against five check varieties (MP 3288, DBW 110, HI 8627 (d), DDW 47 (d), HI 8823) with no, one (CRI stage) and two (CRI and boot leaf stage) irrigations in split plot design with three replications. Irrigation levels were kept in main plots and the genotypes in the sub-plots. The trial was conducted at six locations (Bilaspur, Durgapura, Indore, Jabalpur, Powarkheda and Udaipur). The data of Durgapura centre were not included in pooled analysis due to low mean trial yield and the data of Udaipur centre were not included in pooled analysis due to improper data reporting. Full dose of recommended NPK (90:60:40) was applied as basal in no irrigation treatment and 1/3<sup>rd</sup> nitrogen, full phosphorus (60 kg P<sub>2</sub>O<sub>5</sub>/ha) and potash (40 kg K<sub>2</sub>O/ha) were applied at the time of sowing and remaining N was top dressed at 1<sup>st</sup> irrigation stage in other two main plots. Weed control measures were followed as per the recommended practice. The normalized seed rate used was 100 kg/ha (considering the 1000 grains weight of 38 g).

The centrewise yield and zonal mean are presented in Table 4.5. The pooled analysis presented in Table 4.6 showed that increasing number of irrigations successively produced significantly higher grain yield. One and two irrigation application yielded 17.0% and 25.9% higher grain yield, respectively over no irrigation. All the yield attributing parameters were significantly improved with increased level of irrigation. So, the yield increase was due to cumulative effect of all yield attributing parameters. The check variety DBW 110 ranked 1<sup>st</sup> (38.43 q/ha) followed by test entry CG 1036 (38.33 q/ha) and HI 8830 (d) (38.11 q/ha) and these three genotypes remained statistically at par but significantly higher as compared to other genotypes. Significantly higher number of grains/earhead was reason for maximum yield of check variety DBW 110. Interaction between irrigation levels and genotypes was not found significant for any parameter. Centre wise data are given in Tables 4.6.1 to 4.6.6 of Annexure I.

### **High Yield Potential Trial**

This experiment was conducted to maximise the wheat yield using higher level of inorganic and organic fertilisers and spraying of growth retardant for control of lodging. Experiment consists of two fertiliser treatments viz. NM1 {recommended doses of fertilizers (RDF)} and NM2 {150% NPK + 15 t FYM/ha + two sprays as tank mix-Chlormequat chloride (Lihocin) @0.2% + tebuconazole (Folicur 430 SC) @0.1%} of commercial product dose at first node and flag leaf (tank mix application) stage in main plots. Sub plots consist of four high yielding wheat genotypes (GW 322, DBW187, DBW 303, DBW 372). The trial was conducted in split

Centres: Bilaspur, Indore, Jabalpur, Powarkheda

plot design with three replications at five centres namely BISA Jabalpur, Jabalpur, Powarkheda, Udaipur and Vijapur. The sowing was done using normalized seed rate of 100 kg/ha (adjusted considering 1000 grains weight as 38 g). Irrigation and weed control measures were followed as per recommended package of practices for the concerned zone. The data from Powarkheda were not included in pooled analysis due to low mean yield.

The centrewise yield and zonal mean are shown in Table 4.7. The pooled analysis showed significant effect of fertiliser application and growth regulators on grain yield and yield attributes (Table 4.8). The grain yield enhanced significantly with increasing fertiliser doses. Addition of 15 t FYM/ha with 150% RDF significantly increased the grain yield (70.02 q/ha) as compared to RDF (62.26 q/ha). This increase was to the tune of 12.5% as compared with RDF. The dose of 150%NPK + 15 t FYM/ha+GR significantly (12.6%) enhanced number of earhead/m<sup>2</sup>. (437) compared to RDF (388). The application of growth retardant significantly decreased plant height (91.6 cm) over no use (95 cm). This showed that growth retardant in combination with fungicide tebuconazole was effective for control of lodging and enhancing the grain yield owing to more tillering.

## **Peninsular Zone**

In Peninsular zone, four centres (Akola, Dharwad, Niphad and Pune) were actively engaged in research activities of coordinated wheat agronomy programme. The data on weather and soil parameters are reported in Annexure II and Annexure III, respectively. The soils of this zone fall under the order vertisols and predominantly are clayey in nature with low to high organic carbon ranging between 0.27-0.94 per cent. The available soil nitrogen is low in content ranging between (113 to 272 kg N/ha); while the content of phosphorus is generally high (up to 43 kg/ha) except in few cases where it falls under medium category. The potash content in soil is very high (up to 939 kg/ha) except in few cases where it falls under low category. The soils of this region are predominantly alkaline in reaction. Majority of rainfall received was in the months of October-November except a few showers which were received during later stages in the crop season. The maximum rainfall received was 441.8 mm at Dharwad followed by 325.3 mm at Pune, 132.0 mm at Niphad and 117 mm at Akola. The average maximum and minimum temperatures were 41.1 °C and 8.4 °C at Akola, 39.3 °C and 6.0 °C at Niphad, 38.9 °C and 10.3 °C at Pune, and 36.2 °C and 11.0 °C at Dharwad.

### **EVALUATION UNDER DIFFERENT GROWING CONDITIONS**

The performance of genotypes was evaluated under timely and late sown conditions at different locations and the results are summarized under the following heads:

#### **Irrigated Timely Sown**

In this trial, two *durum* entries MACS4100(d) and HI8826(d) were evaluated against three check varieties MACS3949(d), DDW48(d) and GW322. The trial was conducted to evaluate the performance of timely sown genotypes under timely and late sown conditions at four locations (Akola, Dharwad, Niphad and Pune) in split plot design with sowing time in main plots and genotypes in sub plots with three replications. The allowed period for timely and late sown conditions was kept as 5<sup>th</sup> to 11<sup>th</sup> Nov and 26<sup>th</sup> Nov to 02<sup>nd</sup> Dec, respectively. Sowing was done using the normalized (adjusted considering 1000 grains weight as 38 g) seed rate of 100 kg/ha. The dose of NPK fertilizers was maintained as 120:60:40 kg/ha with 1/3<sup>rd</sup> N, full P and K as basal application during sowing and application of remaining 2/3<sup>rd</sup> N equally in first and second irrigation.

The centrewise and zonal yield of the trial is given in Table 5.1. The results of pooled analysis and centrewise data of yield and yield attributes are presented in Table 5.2 and Annexure-I (Tables 5.2.1 to 5.2.4), respectively. The data from Dharwad and Pune centre were not considered for pooled analysis due to low mean yield under timely sown condition.

The perusal of pooled data revealed that grain yield slightly reduced on shifting the sowing from timely to late condition; however, difference was not significant. The mean grain yield under timely and late sown conditions was found to be 55.76 and 53.13 q/ha, respectively. In terms of yield, the test entry HI8826(d) showed superiorly on timely sowing (63.01 q/ha) and overall basis (57.87 q/ha). It was followed by check variety MACS3949(d) with a mean yield of 55.37 q/ha. The mean yield of other test entry MACS4100(d) was ranked fifth on over all basis. There was a significant decline in thousand grains weight upon shifting the sowing time from timely to late conditions.

### Irrigated Late Sown

In this trial, one genotype DBW320 was evaluated against four checks (HD3090, HI1633, HD2932 and RAJ4083). The trial was conducted to assess the performance of late sown genotype under different sowing time (late and very late) at four locations (Akola, Dharwad, Niphad and Pune). A split plot design with sowing time in main plots and genotypes in sub plots with three replications was considered for experimentation. The allowed period for late and very late sown conditions was kept as 26<sup>th</sup> Nov to 02<sup>nd</sup> Dec and 17<sup>th</sup> to 23<sup>rd</sup> Dec, respectively. The nominal seed rate was kept as 125 kg/ha (adjust seed rate considering

1000 grains weight as 38 g) for late sown conditions. The dose of NPK fertilizers was kept as 90:60:40 kg/ha with 1/3<sup>rd</sup> N, full P and K as basal application during the sowing and application of remaining 2/3<sup>rd</sup> N equally in two splits at first and second irrigation.

The centrewise and zonal yield of the trial is given in Table 5.3. The results of pooled analysis and centrewise data of yield and yield attributes are presented in Table 5.4 and Annexure-I (Tables 5.4.1 to 5.4.4), respectively. The data from Dharwad centre were not taken into account for pooled analysis due to low mean yield under late sown condition. The results of pooled data showed that grain yield declined drastically on changing the sowing time from late to very late condition due to reduced earheads and thousand grains weight under very late sown condition. The mean grain yield under late and very late sown conditions was observed to be 55.53 and 41.68 q/ha, respectively. The mean yield of test entry DBW320 was found as 48.97 q/ha, which was significantly inferior to the best check variety HD 2932 (52.66 q/ha).

## **PRODUCTION TECHNOLOGIES**

In this section, the results of various experiments on updating the package of practices of various wheat growing zones are presented. Various special coordinated trials on weed control, nano urea, NPK solubilizing microbial consortium, maximizing production, use of sea-weed extract, use of RCTs in soybean-wheat system, lodging management, biofortification and fertigation in wheat were conducted to address the various issues in different wheat growing zones of the country.

### **SPL -1: Efficacy of herbicides against diverse weed flora of wheat.**

Weeds are major problem in wheat production. Chemical weed control is preferred over other weed control methods in wheat. Moreover, wheat is infested with diverse weed flora and for control of complex weed flora herbicide combinations are required. Therefore, keeping these in view an experiment involving twelve weed control treatments was conducted across zones at 17 locations.

The sowing was done using the normalized (adjusted considering 1000 grains weight of 38 g) seed rate of 100 kg/ha at a row-to-row spacing of 20 cm. One third nitrogen, full phosphorus and potash as basal dose as per treatments and the remaining 2/3<sup>rd</sup> nitrogen as 1/3<sup>rd</sup> at first irrigation and 1/3<sup>rd</sup> at second irrigation. Weed control measures were followed as per treatments. Herbicide spraying was done using Knapsack sprayer. The observations were recorded on weed density and weed dry weight at 30, 60 and 90 DAS.

In NHZ, this trial was conducted at two locations (Bajaura and Malan). The pooled analysed yield and yield attributes data of two centres are presented in Table 6.1. The minimum wheat grain yield (31.83 q/ha) was recorded with untreated weedy control on pooled basis. Among herbicide treatments, the maximum grain yield was recorded with pre em. tank mix combination of pendimethalin + pyroxasulfone at 1250 + 127.5 g/ha. If we examine the centrewise performance then among herbicide treatments, the maximum grain yield at Bajaura centre was recorded with Pre em. application of pendimethalin at 1500 g/ha (52.55 q/ha) followed by pre em. tank mix combination of pendimethalin + pyroxasulfone at 1250 + 127.5 g/ha (52.46 q/ha). Whereas, at Malan, the maximum grain yield was recorded with pre-em. tank mix combination of pendimethalin + pyroxasulfone at 1250 + 127.5 g/ha. Among herbicide treatments, at Malan, EPOST application of Pyroxasulfone + metsulfuron @ 127.5 + 4 g/ha recorded lowest weed density and dry weight. Whereas, at Bajaura, pendimethalin at 1500 g/ha recorded the lowest weed density and dry weight.

In NWPZ, this trial was conducted at three centres namely Gurdaspur, Hisar and Jammu. The analysis of pooled data as shown in Table 6.3 and 6.4 revealed that herbicide application produced significant effect on grain yield and yield attributes. The highest yield was obtained under weed free situation (51.93 q/ha) which might be attributed to higher and better use of moisture, light, nutrients and space by the crop plants. Among herbicides, pre-emergence application of pyroxasulfone + metribuzin 127.5+280 g a. i./ha showed the least number of weed count of 16.9 and weed dry weight of 15.4 g/ sq. m. at 90 DAS as compared to values of these traits as 112.6 and 161.5, respectively, under weedy check condition followed by pre-emergence tank mix application of pendimethalin + metribuzin at 1280 + 280 g a.i./ha resulted into less weed count of 16.9 and reduced weed dry weight of 15.4 g/sq. m. at 90 DAS. The centre-wise data of yield and weeds have been given in Table 6.3.1 to 6.3.3 and Table 6.4.1 to 6.4.3 of Annexure-I, respectively.

In NEPZ, this experiment was conducted at four locations (Ayodhya, Ranchi, RPCAU PUSA and Shillongani). The pooled analyzed data of these centres are presented in Table 6.5 and 6.6. The perusal of data revealed that the maximum grain yield (49.2 q/ha) was obtained in weed free condition which was at par to pre-emergence tank mix application of Pendimethalin + metribuzin@1250+280 g a.i./ha, Pre-emergence tank mix application of

Pyroxasulfone + metribuzin@127.5+280 g a.i./ha and early post emergence tank mix application of Pyroxasulfone+ metsulfuron@ 127.5 + 4 g a.i./ha. The weed count and weed dry weight were reduced significantly by pre-emergence tank mix application of Pyroxasulfone + metribuzin@127.5+280 g a.i./ha and pre-emergence tank mix application of Pendimethalin + metribuzin@1250+280 g a.i./ha at all growth stages. The gain in grain yield was due to more earhead density, bold grains, less weed infestation. The yield gain in weed free condition over weedy check was 56.7%. Almost similar trend was observed in plant height and bio-mass yield. The centre-wise data of yield and weeds have been given in Table 6.5.1 to 6.5.4 and Table 6.6.1 to 6.6.4 of Annexure-I, respectively.

In CZ, this trial was conducted at six locations (Bilaspur, Durgapura, Jabalpur, Junagadh, Powarkheda, Indore). The pooled analysis of data of six centres is presented in Table 6.7 and 6.8. The perusal of pooled data revealed that among various herbicide and their combination options, there were significant differences in grain yield and yield attributing characters. Treatment having EPOST tank mix application of Pyroxasulfone + metsulfuron @ 127.5 + 4 g a.i./ha produced significantly higher grain yield (52.30 q/ha), and thousand grains weight (47.33, g) as compared other treatments except weed free. Lesser number of weeds and weed dry weight were recorded at different growth stage of crop under EPOST application of pyroxasulfone + metsulfuron@127.5 g a.i./ha. The centre-wise data of yield

and weeds have been given in Table 6.7.1 to 6.7.6 and Table 6.8.1 to 6.8.6 of Annexure-I, respectively.

In PZ, this trial was conducted at Dharwad and Pune centres. The analysis of pooled data as shown in Table 6.9 and 6.10 revealed that herbicide application on grain yield and yield attributes produced significant effect. The highest yield was obtained under weed free situation (52.20 q/ha) possibly due to higher uptake of nutrients by the crop and better aeration. Among herbicides, pre-emergence application of pendimethalin @1500 g a.i./ha showed the least number of weed count of 7.03/m<sup>2</sup> and weed dry weight of 5.25 g/m<sup>2</sup> at 90 DAS as compared to values of these traits as 22.08/m<sup>2</sup> and 21.55 g/m<sup>2</sup> at, respectively,

under weedy check condition. Under early post emergence condition, tank mix application of Pyroxasulfone + metsulfuron @ 127.5 + 4 g a.i./ha resulted into less weed count of 10.98/m<sup>2</sup> and reduced weed dry weight of 8.05 g/m<sup>2</sup> at 90 DAS over data of these traits as 22.08/m<sup>2</sup> and 21.55 g/m<sup>2</sup>, respectively, under weedy check condition. The centre-wise data of yield and weeds have been given in Table 6.9.1 to 6.9.2 and Table 6.10.1 to 6.10.2 of Annexure-I, respectively.

## **SPL-2: Sea weed extract usage in wheat**

Sea weed is an important naturally occurring plant nutrients source, and hence its extract is being explored for supplying a variety of naturally available plant nutrients which may play a key role in realizing wheat crop yield potential and thus, making the best out of waste. For exploring the role of sea weed extract in improving nutrients usage in wheat under wheat based cropping systems a field trials were conducted across the wheat growing zones.

In NHZ, this experiment was conducted at two locations (Bajaura and Malan). The perusal of pooled data presented in Table 6.11 revealed that maximum wheat grain yield (47.56 q/ha) was obtained in treatment where wheat crop seed was treated with sea weed extract followed by two foliar spray of sea weed extract 4ml/litre of water at tillering and heading. This treatment resulted in higher yield due to better earhead density (422/sq.m.), heavier grains weight (43.55 g/1000 grains weight), more number of grains per earhead (26.22) and the highest biomass production (107.48 q/ha). Seed treatment with sea weed extract at the rate of 3.0 ml per kg of weed seed before sowing of the crop also resulted in significantly higher grain and biomass yield (Table 6.2) as compared to control (without seed treatment). Mean sea weed extract foliar application response showed significantly higher yield when applied at both tillering and heading stages at 4.0 ml/litre of water as compared to all other stages of crop growth and lower dose (2.0 ml/litre of water) of sea weed extract spray. Except, plant height the interaction effects were non-significant for yield and yield attributes parameters. Centre wise data are given in Annexure- I as Tables 6.11.1 and 6.11.2.

In NWPZ, the experiment on seaweed extract was conducted at three locations (Delhi, Gurdaspur and Jammu). The perusal of pooled analysis data presented in Table 6.12 showed that seed treatment with seaweed extract made significant increase in grain yield (51.65 q/ha) over untreated control (50.92 q/ha). The maximum mean grain yield (53.18 q/ha) was observed with two foliar spray of seaweed extract using 4 ml/lit dose at tillering and heading stages followed by two foliar spray of seaweed extract using 2 ml/lit dose at tillering and heading stages (52.13 q/ha). The mean wheat yield with seed treatment was 1.43% higher than the practice of untreated seed. The centrewise data have been given in Table 6.12.1 to Table 6.12.3 of Annexure-I.

In NEPZ, this experiment was conducted at four locations (Coochbehar, Ranchi Sabour , and Varanasi). The pooled analyzed data of these centres are presented in Table 6.13. The perusal of data revealed that there was non-significant effect of seed treatment and foliar application on the grain yield, earhead / m<sup>2</sup>, grains per earhead and 1000 grains weight. The maximum grain yield (48.66 q/ha) was obtained by foliar application of seaweed extract (CP\*)@ 4ml/litre water at tillering stage. Centre wise data are given in Tables 6.13.1 to 6.13.4 of Annexure-I.

In CZ, this trial was conducted with an objective to maximize wheat productivity by the use of seaweed extract as seed treatment and foliar application at three locations (Dhanduka, Durgapura and Udaipur). A perusal of pooled data (Table 6.14) revealed that among various sea weed extract treatments there were significant differences in grain yield. Maximum grain yield (52.42 q/ha) was recorded for foliar application of seaweed extract (CP\*)@ 4ml/litre water at tillering & heading treatment along with seed treatment and was followed by foliar application of seaweed extract (CP\*)@ 2ml/litre water at tillering & heading stage (49.91 q/ha). Seed treated with seaweed extract also produce significantly higher mean grain yield (45.91 q/ha) than untreated seed (42.13 q/ha). The centre wise data have been illustrated in Tables 6.14.1 to 6.14.3 of Annexure-I.

In PZ, the experiment on seaweed extract was conducted at three locations (Akola, Dharwad and Niphad). The perusal of pooled analysis data presented in Table 6.15 showed that seed treatment with seaweed extract made significant increase in grain yield (42.97 q/ha) over untreated control (40.64 q/ha). The maximum mean grain yield was observed with two foliar spray of seaweed extract using 4 ml/lit dose at tillering and heading stages. However, spray of seaweed extract with upper dose (4 ml/lit) either at tillering or heading stage and seaweed extract spray with low dose (2ml/lit) at heading stage produced similar mean grain yield as with spray of seaweed extract @ 4 ml/lit at both stages. The mean wheat yield with seed treatment was 5.73% higher than the practice of untreated seed. The centrewise data are given in Table 6.15.1 to Table 6.15.3 of Annexure-I.

### **SPL-3: Maximizing wheat productivity through nano urea usage under irrigated condition**

This experiment was conducted to explore the possibility of maximizing wheat productivity by integrated use of nano urea. The experiment was laid out in randomised complete block design with thirteen treatments viz. control (No N) and 50, 75 and 100% of Rec N rates along with either one spray of nano urea or two spray of nano urea or two spray of urea. One third nitrogen as per treatment, full phosphorus and potash as basal dose and the remaining 2/3<sup>rd</sup> nitrogen as 1/3<sup>rd</sup> at first irrigation and 1/3rd at second irrigation were applied. Irrigation and weed control measures were followed as per recommended package of practices for the concerned zone.

In NHZ, this experiment was conducted at Almora centre only. The data presented in Table 6.16 showed that the lowest grain yield (24.52 q/ha) was recorded in no N application control treatment. In comparison to control, all the treatments caused significant yield improvement. No specific trend with regards to nano urea applications was observed.

**Table 6.16. Northern Hill Zone**

50% N + Two spray of 5% urea at tillering & jointing	309	50.55	22.29	34.75	105.09	90.4
Control (without N only)	257	48.77	19.37	24.52	68.91	75.5
CD(0.05)	37.64	2.34	5.73	8.43	22.17	4.89

In NWPZ, this experiment was conducted at eight locations (Delhi, Gurdaspur, Gwalior, Hisar, Jammu, Karnal, Ludhiana and Panthagar). The perusal of pooled analysis data presented in Table 6.17 showed that application of recommended N (rec. N - 1/3<sup>rd</sup> as basal, 1/3<sup>rd</sup> at CRI and 1/3<sup>rd</sup> at jointing as 150:60:40 kg NPK/ha) and two spray of nano

urea at tillering and jointing stage produced the maximum grain yield of 50.52 q/ha. However, the grain yield with rec. N + two spray of simple urea (5%) at tillering and joining stage (49.45 q/ha) and with rec. N + one spray of nano urea at tillering (49.26 q/ha) were at par with rec. N + two sprays of nano urea. The addition of two spray of nano urea at tillering and jointing stage with recommended N fertilization brought an increase of 6.38% in grain yield over rec. N treatment. The yield gain might be due to the bolder grains with thousand grains weight of 38.16 g in nano urea spray against 36.93 g for recommended dose of N fertilizer without any spray. The centrewise data have been given in Table 6.17.1 to Table 6.17.8 of Annexure-I.

**Centres:** Delhi, Gurdaspur, Gwalior, Hisar, Jammu, Karnal, Ludhiana and Pantnagar

In NEPZ, this experiment was conducted at five locations (Burdwan, Coochbehar, Ranchi, Sabour and Varanasi). The pooled analyzed data of these centres are presented in Table 6.18. The perusal of data revealed that the maximum grain yield (48.23 q/ha) was obtained under recommended N Dose + two sprays of nano urea at tillering & jointing stage treatment, which was at par to recommended N Dose + one spray of nano urea at tillering and recommended N Dose+ two spray of urea (5%) at tillering & jointing and significantly superior to all other treatments . This gain in grain yield was due to more earhead density and bold grains. The yield gain in recommended N Dose + two spray of nano urea at tillering & jointing stage treatment over control was 120%. Centre wise data are given in Tables 6.18.1 to 6.18.5 of Annexure-I.

**Table 6.18. North Eastern Plains Zone**

In CZ, this trial was conducted at seven locations (Bilaspur, Durgapura, Jabalpur, Junagadh, Powarkheda, Indore, Vijapur). The pooled analysis of data of seven centres presented in Table 6.19 revealed that maximum grain yield (54.02 q/ha) was produced under treatment of rec. N+ two spray of nano urea at tillering and jointing, followed by rec. N+ two spray of urea (5%) at tillering and jointing (53.13 q/ha) and rec. N+ one spray of nano urea at tillering (52.34 q/ha). All three treatments were statistically at par but significantly better than other treatments. The centre wise data have been illustrated in Tables 6.19.1 to 6.19.7 of Annexure-I.

**Centres:** Bilaspur, Durgapura, Indore, Jabalpur, Junagadh, Powarkheda, Vijapur

In PZ, this experiment was conducted at four locations (Akola, Dharwad, Niphad and Pune). The perusal of pooled analysis data presented in Table 6.20 showed that application of recommended N and two spray of nano urea at tillering and jointing stage produced the maximum grain yield of 48.78 q/ha. However, the grain yield with two spray of urea (5%) at tillering and joining stage was at par to two spray of nano urea. The addition of two spray of nano urea at tillering and jointing stage with recommended N fertilization brought an increase of 8.14% in grain yield over base treatment. The treatment of 75% N + two spray of urea (5%) produced the bolder grains with thousands grains weight of 43.55 g against 41.22 g for recommended dose of N fertilizer without any spray. The centrewise data are given in Table 6.20.1 to Table 6.20.4 of Annexure-I.

#### **SPL- 4: Effect of nano urea under restricted irrigation conditions**

In NHZ, this trial was conducted at one location namely Bajaura. The data presented in Table 6.21 clearly reveal that significantly highest wheat grain yield (54.24 q/ha) was obtained by applying recommended dose of N along with spray of urea (5%) + nano urea at tillering stage. The minimum grain yield (20.45 q/ha) was recorded in absolute control (No nitrogen). Compared to control treatment, application of two spray of nano urea alone at tillering and jointing significantly increased the grain yield (26.18 q/ha). Also, compared to recommended N, one or two spray of either nano urea or urea significantly improved the grain yield. In comparison to control, combination of Rec. N with either nano urea or urea resulted in significant improvement in earhead density, 1000 grains weight, grains per erahead, biomass and plant height.

**Table 6.21. Northern Hill Zone**

Treatments	Earheads/ m <sup>2</sup>	SPL-4 1000 Grains Weight, g	Bajaura Grains/ Earhead	Yield, q/ha	Biomass, q/ha	Plant ht., cm

CD (0.05)	23.58	2.24	1.87	3.57	9.19	3.59

In NWPZ, this experiment was conducted at four locations (Gwalior, Hisar, Karnal and Panchnagar). The perusal of pooled analysis data presented in Table 6.22 showed that application of recommended N {Rec N (1/3<sup>rd</sup> basal, 2/3<sup>rd</sup> CRI)} and two spray of nano urea at tillering and jointing stage produced the maximum grain yield of 47.70 q/ha followed by recommended N and one spray of 5% urea + one spray of nano urea at tillering stage (47.11 q/ha) which was at par with former. The addition of two spray of nano urea at tillering and jointing stage with recommended N fertilization brought an increase of 4.9% in grain yield over recommended N treatment. The centrewise data are given in Table 6.22.1 to Table 6.22.4 of Annexure-I.

**Centres:** Gwalior, Hisar, Karnal and Panchnagar

In NEPZ, this experiment was conducted at five locations (Ayodhya, Burdwan, Kanpur, RPCAU PUSA and Shillongani). Burdwan centre was excluded due to very low yield. The pooled analyzed data of these centres are presented in Table 6.23. The perusal of data revealed that the maximum grain yield (45.8 q/ha) was obtained under recommended N +

one spray of urea (5%) + nano urea at tillering (40-45 DAS), which was at par to recommended N + two sprays of urea (5%) at tillering (40-45) and Jointing (60-65 DAS) and was significantly superior to all other treatments . This gain in grain yield was due to more earhead density and bold grains. The yield gain in recommended N + one spray of urea (5%) + nano urea at tillering (40-45 DAS) treatment over control was 94.06%. Centre wise data are given in Tables 6.23.1 to 6.23.5 of Annexure-I.

**Table 6.23. North Eastern Plains Zone**

### **SPL-5: Lodging management for enhancing yield of *dicoccum* wheat using plant growth regulators**

In CZ, this trial was conducted with an objective to reduce lodging and to enhance the yield potential of improved dicoccum wheat by using growth regulators at Durgapura centre. This trial was conducted with three genotypes i.e. MACS 2971, DDK 1029, and HW 1098 in main plots and five growth regulator combinations in sub plots and replicated thrice. The data presented in Table 6.25 revealed that all three genotypes produced statistically at par yield, though the genotype MACS 2971 proved numerically superior with 43.78 q/ha grain yield. Among plant growth regulator treatments, CCC (2 chloroethyl- trimethyl ammonium chloride) @ 1500 ppm was ranked first with 45.27 q/ha yield and it was statistically at par with CCC (2 chloroethyl- trimethyl ammonium chloride) @ 1000 ppm (43.49 q/ha) but significantly higher as compared to all other treatments.

In PZ, this experiment was conducted at three locations (Dharwad, Niphad and Pune). The perusal of pooled analysis data presented in Table 6.26 revealed that application of CCC (2 chloroethyl- trimethyl ammonium chloride) @1500 ppm produced the maximum mean grain yield of 47.03 q/ha. The application of ethephon either with 10 or 30 ppm also produced statistically similar grain yield. The effect of variety and growth regulator on grain yield was found to be significant. The maximum mean grain yield was found to be 47.62 q/ha for MACS 2971 followed by 46.18 and 42.69 q/ha for DDK 1029 and HW 1098, respectively. The application of all plant growth regulators resulted into bolder grains and lesser plant height over control condition. The centrewise data are given in Tables 6.26.1–6.26.3 of Annexure-I.

### **SPL-6: Resource conservation techniques for enhancing the productivity and resource-use efficiency of soybean-wheat cropping system**

In PZ, this experiment was conducted at three locations (Dharwad, Niphad and Pune). The experiment was conducted in split-plot design having tillage and crop establishment (Conventional tillage-flat bed, zero tillage-flat bed, conventional tillage-broad bed and zero tillage-broad bed) as main plots and residue managements (Control, wheat residue 3t/ha, soybean residue @3t/ha and soybean + wheat residue @3t/ha) in sub-plots. Nutrient application consisted of 120:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O/ha. One third nitrogen, full phosphorus and potash were applied as basal dose and the remaining 2/3<sup>rd</sup> nitrogen as 1/3<sup>rd</sup> at first irrigation and 1/3<sup>rd</sup> at second irrigation. The perusal of pooled analysis data presented in Table 6.27 revealed that grain yield was maximum under conventionally tilled broad bed method; however, effect of tillage method on grain yield was not significant. The use of soybean residue either alone or in combination with wheat residue produced higher grain yield over control. The combined application of soybean and wheat residue with 3 t/ha each

resulted into 10.53 and 5.5% higher grain yield than treatments of control and wheat residue application (3t/ha), respectively. The increase in grain yield with soybean and wheat residue application was associated with bolder grains with more weight of thousand grains. The centrewise data are given in Tables 6.27.1–6.27.3 of Annexure-I.

**Centres:** Dharwad, Niphad, Pune

### **SPL-7: Precision nutrient management for higher yield in wheat through fertigation**

In PZ, this experiment was conducted at Dharwad centre. The experiment was conducted in split-plot design having drip irrigation system (surface drip irrigation and subsurface drip irrigation) as main plots and nutrient managements in sub-plots. Nutrient application consisted of 120:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O/ha. One third nitrogen, full phosphorus and potash were applied as basal dose and the remaining 2/3<sup>rd</sup> nitrogen as 1/3<sup>rd</sup> at first irrigation and 1/3<sup>rd</sup> at second irrigation. The data of Dharwad centre presented in Table 6.28 revealed that effect of drip irrigation on grain yield was not significant. Among nutrient management options in sub-plots, the treatment of 100% NPK through water soluble fertilizer at fortnight interval produced the maximum grain yield of 42.69 q/ha as compared to 36.23 q/ha under control treatment (surface irrigation with 100% RDF). The grain yield with treatment having 1/3<sup>rd</sup> NP basal + 2/3<sup>rd</sup> NP weekly interval (8 splits) through drip irrigation was also statistically at par. The maximum grain yield with water soluble fertilizer application was in response to increased earheads, more thousand grains weight and higher biomass production over other treatments.

### **SPL-8: Improving wheat yield through foliar K application**

In NWPZ, the experiment on foliar K application was conducted at one location at Jammu only. The experiment was conducted in split-plot design having irrigation levels (one, two and three) in main plots and foliar K application (control, 2% K application at tillering & jointing and 4% K application at tillering & jointing) in sub-plots. One third nitrogen, full phosphorus and potash were applied as basal dose and the remaining 2/3<sup>rd</sup> nitrogen was applied during first and second irrigation equally. The perusal of data presented in Table 6.29 showed that number of irrigations brought significant effect on grain yield, earheads, grains/earhead and biomass. The maximum mean grain yield of 38.53 q/ha was observed with three irrigations, which was 40.26 and 6.82% higher than mean grain yield under one and two irrigation condition, respectively. Among treatments in sub-plots, the mean grain yield (34.78 q/ha) was the maximum with 4% K application and numerically better than 34.14 and 33.14 q/ha under 2% K application and control, respectively. The increase in grain yield with foliar K application was in response to more earheads and elevated thousand grains weight over control treatment.

In NEPZ, this experiment was conducted at two locations (Kanpur and Shillongani). The pooled analyzed data of these centres are presented in Table 6.30. The perusal of data revealed that there was significant effects of irrigation levels and foliar application of K on the grain yield. Significantly higher grain yield (45.58 q/ha) was achieved by application of irrigation at crown root initiation and flowering stage over single irrigation at CRI stage. Foliar

Date of Sowing:	14.11.2021	Date of Harvesting:				

application of 4% K resulted in significantly higher yield (45.90 q/ha) over spraying of water only although it was at par to foliar application of 2 % K. Similar trend was also observed in earhead density. There was non-significant effect on 1000 grain weight due to irrigation levels and foliar application of K. Centre wise data are given in Tables 6.30.1 to 6.30.2 of Annexure-I.

**Centres:** Kanpur and Shillongani

In CZ, this trial was conducted with an objective to reduce moisture stress and to enhance the yield potential of wheat by using potash spray. This trial was conducted with three irrigation levels in main plots and three foliar application of K in sub plots having three replications at four locations (Dhanduka, Durgapura, Jabalpur, Vijapur). The pooled analysis of data of four centres presented in Table 6.31 revealed that maximum and significantly higher grain yield (38.37 q/ha) was produced in three number of irrigations (at CRI, late jointing and milking stage). Among foliar application of K treatments, 4 % K application at tillering and jointing produced significantly higher yield (35.30 q/ha) than 2 % K application at tillering (40-45) and jointing (60-65 DAS) (33.98 q/ha) and control (31.30 q/ha). Significantly higher number of earheads per meter square was responsible for significantly higher grain yields.

In PZ, the experiment on foliar K application was conducted at two locations (Dharwad and Pune). The perusal of pooled data presented in Table 6.32 showed that number of irrigations brought significant effect on grain yield, earheads, grains/earhead and biomass. The maximum mean grain yield of 32.66 q/ha was observed with three irrigation, which was 32.12 and 10.64% higher than mean grain yield under one and two irrigation condition, respectively. Among treatments in sub-plots, the mean grain yield (31.04 q/ha) was maximum with 4% K application as compared to 29.02 and 26.83 q/ha under 2% K application and control, respectively. The increase in grain yield with foliar K application was

in response to more earheads and elevated thousand grains weight over control treatment. The centrewise data are presented in Table 6.32.1 and 6.32.2 of Annexure-I.

### SPL-9: Agronomic interventions for quality enhancement in wheat varieties across different wheat growing zones

In NWPZ, this trial was conducted with an objective to enhance quality of wheat varieties by foliar spray of sulphur (S), nitrogen (N), zinc (Zn), potash (K) and their combinations at four centres (Gurdaspur, Hisar, Ludhiana and Pantnagar). This trial was conducted having four genotypes (HD 3226, HI 1544, DBW 187, and PBW 1 Zn) and with six combinations of foliar fertilization in split plot design replicated thrice. The pooled analysis of data presented in Table 6.33 and 6.34 revealed that the maximum mean grain yield (49.59 q/ha) was produced under the treatment of S+N+Zn+K (all nutrients spray) which remained statistically at par with all treatments except no foliar application of nutrients (control). Among varieties, DBW187 produced the maximum and significantly higher grain yield (53.41 q/ha) than all the other varieties. Maximum and significantly higher iron (Fe) content (37.26 ppm) was recorded in PBW 1 Zn genotype whereas there was no significant difference due to foliar fertilization. Maximum and significantly higher zinc content (39.68 ppm) was found in HD 3226 genotype followed by in PBW 1 Zn genotype (38.28 ppm) and

in treatment of foliar fertilization Zn (41.76ppm) followed by the treatment of S+N+Zn+K (40.86 ppm). Maximum and significantly higher protein content (14.3 %) and maximum hectolitre weight (74.81 kg) was recorded in genotype HD 3226 indicating better quality and density (heaviness) of grains. The centrewise data of yield and quality parameters are given in Table 6.33.1 to 6.33.4 and Table 6.34.1 to 6.34.4 of Annexure-I, respectively.

In NEPZ, this experiment was conducted at Kanpur center only. The analyzed data is presented in Table 6.35. The perusal of data revealed that there was significant effects of foliar spray of S, N, Zn, K and their combinations on the grain yield, whereas different genotypes vary non-significantly. The highest grain yield (38.88 q/ha) and grains per earhead were observed in HI 1544 genotype when Zn (0.5% ZnSO<sub>4</sub>.7H<sub>2</sub>O) was sprayed. Significantly higher Fe content was observed through foliar spray of S+N+Zn+KCl, whereas foliar spray of Zn (0.5% ZnSO<sub>4</sub>.7H<sub>2</sub>O) resulted in significantly higher Zn content.

In CZ, this trial was conducted at Vijapur centre. This trial was conducted with four genotypes (HD 3226, HI 1544, DBW 187, and PBW 1 Zn) and six combinations of foliar fertilization in split plot design and replicated thrice. The analysis of data presented in Table 6.36 revealed that no significant effect of genotypes and foliar fertilization were observed for yield and yield attributes. Maximum grain yield (45.21 q/ha) was produced under the treatment of N (2% urea spray) though statistically all treatments remained at par. Maximum and significantly higher Fe content (37.52 ppm) was recorded in PBW 1 Zn genotype however there was no significant difference due to foliar fertilization. Maximum and significantly higher zinc content (40.16 ppm) was found in PBW 1 Zn genotype and among foliar fertilization treatment S+N+Zn+KCl. Maximum and significantly higher hectolitre weight (81.67) was found in genotype HI 1544.

#### **SPL- 10: Effect of NPK solubilizing microbial (Rhizosphere) consortium on productivity of wheat**

An experiment on evaluation of the effect of NPK solubilizing microbial (Rhizosphere) consortium on productivity of wheat under irrigated condition was conducted at one location (Shimla) in NHZ. The four rates of NPK fertilizers, control (No NPK), 50% Recommended NPK, 75% Rec. NPK and 100% Rec NPK were applied in combination of with and without seed treatment of NPK solubilizing microbial (Rhizosphere) consortium. For seed treatment, 2.5 ml of NPK solubilizing microbial (Rhizosphere) consortium was diluted to 25 ml with water and a pinch of sugar is added to it. This suspension is then sprinkled on the seeds and thoroughly mixed to have uniform coating. The treated seeds were then dried in shade before seeding. The recommended dose of NPK was 150:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O. Full dose of P and K and 1/3<sup>rd</sup> dose of N were applied as basal. Remaining 2/3<sup>rd</sup> N was applied in two equal splits at first and second irrigation.

In NHZ, the application of recommended dose of NPK with and without seed treatment recorded significantly higher grain yield compared to all the lower doses of NPK applied with and without seed treatment (Table 6.37). The lowest grain yield (17.85 q/ha) was recorded in control plots (no fertilizer and no seed treatment). The wheat grain yield was significantly increased with the increase in NPK rates. The seed treatment did not cause any significant

yield improvement except at 75% Rec NPK rates. The absolute control plots recorded lesser earhead density, thinner grains, lesser biomass and shortest plants. Whereas, the treatment of 100% Rec NPK with seed treatment recorded highest earhead density ( $331/m^2$ ), 1000 grains weight (44.0 g), and biomass (109.52 q/ha).

In NWPZ, this experiment was conducted at five centres viz., Gurdaspur, Hisar, Jammu, Karnal and Ludhiana. The experiment was conducted in RBD design having control, 50% recommended NPK, 75% NPK and 100% NPK with and without seed treatment (Bio NPK @2.5 ml/kg). The recommended dose of fertilizer was maintained as 150:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O/ha. One third nitrogen, full phosphorus and potash were applied as basal dose and the remaining 2/3<sup>rd</sup> nitrogen was applied during first and second irrigation equally. The pooled data of all the five centres presented in Table 6.38 showed that the maximum grain yield of 57.05 q/ha was recorded with 100% NPK + seed treatment with Bio NPK @2.5 ml/kg followed by 54.50 q/ha with 100% NPK. The seed treatment with Bio NPK @2.5 ml/kg brought about significant improvement in grain yield only under control and with 100% NPK treatments. The significant change in biomass with seed treatment was observed only with treatment of 100% NPK. The effect of seed treatment with Bio NPK @2.5 ml/kg in remaining conditions and traits was not significant. The centre wise data have been illustrated in Tables 6.38.1 to 6.38.5 of Annexure-I.

In NEPZ, this experiment was conducted at three locations (IARI PUSA, RPCAU PUSA and Varanasi). The pooled analyzed data of these centres are presented in Table 6.39. The perusal of data revealed that the maximum grain yield (42.6 q/ha) was obtained under 100% recommended NPK + seed treatment with Bio NPK @ 2.5 ml/kg and was significantly superior to all other treatments except 100% recommended NPK . This gain in grain yield was due to more earhead density and bold grains. The yield gain in 100% recommended NPK + seed treatment with Bio NPK @ 2.5 ml/kg treatment over control was 91.9 %. Similar trend was observed in bio mass yield. Centre wise data are given in Tables 6.39.1 to 6.39.3 of Annexure-I.

In CZ, this trial was conducted at three locations (Indore, Junagadh, Vijapur). The pooled analysis of data of three centres presented in Table 6.40 revealed that maximum grain yield (54.87 q/ha) was produced by the treatment 100% Rec. NPK + seed treatment with Bio NPK @2.5ml/kg followed by 100% Rec. NPK (54.25 q/ha) and both these treatments remained statistically at par. The grain yield produced with 100% recommended NPK application either with or without seed treatment was significantly higher compared to other treatments.

In PZ, this experiment was conducted at Pune centre. The data of Pune centre presented in Table 6.41 showed that the maximum grain yield of 55.77 q/ha was recorded with 100% NPK + seed treatment with Bio NPK @2.5 ml/kg followed by 53.78 q/ha with 100% NPK. The seed treatment made significant improvement in grain yield only under control and 100% NPK treatments. The significant change in biomass with seed treatment was observed only with treatment of 100% NPK. The effect of seed treatment in remaining condition and traits was not significant.

### SPL-11: Improving wheat productivity through silica foliar application

In PZ, the experiment on foliar silica application (KSi) was conducted at Dharwad centre. The experiment was conducted in split-plot design having irrigation levels (one, two and three) in main plots and foliar silica application (control, 2 ml KSi/litre of water at tillering & jointing and 4 ml KSi/litre of water at tillering & jointing) in sub-plots. The recommended dose of fertilizer was maintained as 120:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O/ha. One third nitrogen, full phosphorus and potash were applied as basal dose and the remaining 2/3<sup>rd</sup> nitrogen was applied during first and second irrigation equally. The seed rate of 100 kg/ha for timely sown conditions (adjust seed rate considering 1000 grains weight as 38 g) was used in the experiment. The data of Dharwad centre presented in Table 6.42 showed that neither irrigation levels nor foliar silica application could not make significant effect on grain yield. The mean grain yield across irrigation levels was found in the range of 27.66-30.28 q/ha while across the foliar silica application, it was between 27.39-31.09 q/ha. The increase in number of irrigation levels raised the biomass yield with maximum value of 58.11 q/ha under three irrigation levels. The maximum value of earheads, thousand grains weight and biomass was observed with foliar application of 2 ml Silica (KSi)/litre of water at tillering & jointing stage.

### **SPL-12: Improving wheat productivity through nutrients solubilizing microbial (Rhizosphere) consortium**

In PZ, this experiment was conducted at Dharwad centre. The experiment was conducted in RBD design having control, seed treatment with microbial consortium @ 2ml/kg and 4 ml/kg each with 50% recommended dose of NPK and 75% NPK, combination of seed treatment and spray (2 ml/kg seed treatment + spray of 2% microbial consortium at 20-25 DAS and 4 ml/kg seed treatment + spray of 4% microbial consortium at 20-25 DAS with 50% and 75% recommended dose of NPK and seed treatment (2 and 4 ml/kg) with 100% NPK. The recommended dose of fertilizer was maintained as 120:60:40 kg N, P<sub>2</sub>O<sub>5</sub> and K<sub>2</sub>O/ha. One third nitrogen, full phosphorus and potash were applied as basal dose and the remaining 2/3<sup>rd</sup> nitrogen was applied during first and second irrigation equally. In all treatments, recommended dose of 15 t/ha FYM was applied uniformly. The data of Dharwad centre presented in Table 6.43 showed that the maximum grain yield of 38.73 q/ha was recorded with 75% Rec. NPK + seed treatment with microbial consortium @4 ml/kg seed + 4% microbial consortium spray at 20-25 DAS as compared to 18.91 q/ha for control treatment.

**LIST OF CENTRES AND COOPERATING SCIENTISTS WORKING UNDER RESOURCE MANAGEMENT PROGRAMME OF THE AICW&BIP (2021-22)**

**NORTHERN HILLS ZONE**

1. Almora Dr Amit Tamta, Scientist (Agronomy),  
Division of CPD, VPKAS, Almora, Uttarakhand-263 601.  
*Email: amuvpkas@gmail.com, Mobile:*
2. Bajaura\* Dr Gurudev Singh, Assistant Agronomist,  
CSK HPKV, HAREC, Bajaura-175 125, Kullu, HP.  
*Email: gdevsaandil@rediffmail.com, Mobile: 09418479856*
3. Khudwani Dr Nazir Ahmad, Scientist Agronomy,  
NRCFC, SKUAST-K, Khudwani, Anantnag- 192 102, J&K, India.  
*Email: nazirteeli@gmail.com, Mobile: 08825036154.*
4. Malan\* Dr Ajay Deep Bindra, Scientist (Agronomy),  
CSKHPKV, RWRC, Malan-176 047, Distt. Kangra, HP.  
*Email: abbindra03@yahoo.co.in; Mobile: 094181 49795*
5. Shimla Dr Dharam Pal, Senior Scientist (Plant Breeding),  
IARI Regional Station, Tutikandi, Shimla-171 004, HP.  
*Email: dpwalia@rediffmail.com; Mobile:09817163305*

**NORTH WESTERN PLAINS ZONE**

1. BISA Ladowal Dr. Uttam Kumar, Associate Scientist,  
Borlaug Institute for South Asia (BISA),  
Ladowal Ludhiana (Punjab); India  
*Email: u.kumar@cgiar.org, Mobile: 9780336810*
2. Gurdaspur Dr Mandeep Kaur Saini Agronomist,  
PAU Regional Research Station, Gurdaspur- 143521, Punjab.  
*Email ID: kaurmandeepsaini@pau.edu, Mobile-94647 42595*
3. Gwalior\* Dr Nisha Singh (Agronomy),  
Wheat Improvement Project, College of Agriculture,  
RVSKVV, Gwalior -474 002, MP.  
*Email: bhadauria.snisha2011@gmail.com; Mobile:9165358818*
4. Hisar\* Uma Devi, Assistant Wheat Agronomist,  
Department of Agronomy, CCS HAU, Hisar (Haryana)-125 004.
