ACKNOWLEDGEMENT

The Resource Management Group of the ICAR-Indian Institute of Wheat and Barley Research expresses sincere thanks to;

- *The Director, IIWBR, Karnal for providing the facilities and support for smooth execution of the Resource Management programme.*
- *The scientists of the cooperating centres for successful implementation of the Resource Management programme.*
- *The technical staff of the Institute Sh Ram Kumar Singh, Sh PHP Verma, Sh Rajinder Pal Sharma and Sh Sukh Ram and skilled supporting staff Sh Desh Raj for their help in successful execution of the Resource Management programme.*
- *The administrative, finance and farm services of the Indian Institute of Wheat and Barley Research for their cooperation and support to the Resource Management Programme.*
- *The Reprographic Unit In-charge, Dr Ajay Verma and his team comprising of Dr Lokendra Kumar, Dr Poonam Jasrotia, Dr R Sendhil and Dr Rinki Khobra, Sh Bhim Sain and Ronak Ram for photo-multiplying the document.*

The authors are also thankful to all those who might have helped directly or indirectly in effective execution of the programme.

SUMMARY

India harvested an all time record wheat production of more than 97 million tonnes during the year 2016-17 despite shrinking land and water resources, climate abrasions and little genetic gain. This has been made possible by Indian farmers and scientists through efficient management of natural resources and various external inputs like chemical fertilizers and pesticides. The imbalanced fertilisation and intensive tillage are still matters of concern. The multiple nutrient deficiencies are being reported which is a result continuous mining of the soil coupled with imbalanced fertilisation. Nitrogen is generally applied in excess and potash and micronutrients are rarely applied. The situation is further worsened by crop residues burning, which besides causing losses of precious organic source and essential nutrients also leads to environmental pollution causing health hazards. In order to provide food security and reverse the trend in natural resource degradation, technological advancements including developing better varieties suited to different cropping systems and growing conditions in various agro-ecological zones is a must. The higher agricultural productivity has to be achieved along with the improvement or at least without further detrimental effect to the environment and natural resources for long-term sustainability. Research efforts are focussed, in addition to varietal improvement, on the refinement of the technologies, diversification/intensification by including leguminous crops, integrated nutrient and weed management, to make food production cost and energy efficient in order to increase the profit margins to the farmers.

The Resource Management group of the “All India Co-ordinated Research Project on Wheat and Barley” (AICRP-W&B), in addition to evaluating the performance of newly developed genotypes, is also actively engaged in developing and fine tuning the farmers’ and eco-friendly, location specific and cost effective technologies for higher productivity and profitability. The work on cost effective technologies is being executed through special coordinated trials depending on the priorities of various wheat growing zones. The results of the multi-location varietal evaluation and special co-ordinated trials are summarised hereunder.

In three wheat growing zones, four varietal evaluation trial series were conducted to evaluate six final year genotypes at a number of locations under different growing conditions. The newly developed genotypes were evaluated against the existing varieties used as checks. In addition, twelve special coordinated trials were also conducted to address the zone-wise problems and priorities.

The zone-wise details of the varietal evaluation trials conducted are given in Table 1. In all, 32 trials were proposed of which 31 were conducted. Out of the conducted trials, 02 were rejected due to improper time of sowing. The overall conduct of trial was 96.8 percent with a success and rejection rate of 93.5 percent and 6.5 percent, respectively. In NWPZ, out of 12 proposed trials, all were conducted but 2 were rejected due to improper sowing time. In NEPZ and PZ, 10 trials were proposed in each zone out of which 10 and 09 were conducted successfully in NEPZ and PZ, respectively. Annigeri centre did not conduct RF-TAS-LON

trial. The centres where the trials were not conducted or where the trials were rejected have been listed in the Table 1.

Table 1. Zone-wise details of the coordinated varietal evaluation trials

The performance of test entries has been presented in the Table 2. The performance showed that in NWPZ, the single test entries in the AVT-II year was statistically at par with the best check HD 3059. In NEPZ, the lone test genotype HI 1612 performed significantly better than the best check K 1317 with a yield gain of 2.44%. In PZ, test entry UAS 375 gave numerically better yield than the respective best check NI 5439 with a yield gain of 4.15 percent. Both the durum test entries HI 8777, MACS 4028 were poorer than the respective best check UAS 446.

The details of the special coordinated trials conducted in different zones are presented in Table 3. In all, 123 trials were proposed, out of which 115 were conducted with the conduct percentage was 93.5. The maximum number of special trials were conducted in North Western Plains Zone (42) followed by Central Zone (23), North Eastern Plains Zone (23), Northern Hills Zone (15) and Peninsular Zone (12).

NORTH WESTERN PLAINS ZONE

In North Western Plains Zone, one varietal evaluation trial under irrigated late sown was conducted at ten locations namely Bikaner, Durgapura, Delhi, Gurdaspur, Hisar, Jammu, Karnal, Ludhiana, Pantnagar and Srigananagar, to evaluate the performance of new genotype DBW 173 which was found statistically at par with the best check HD 3059 (Figure 1).

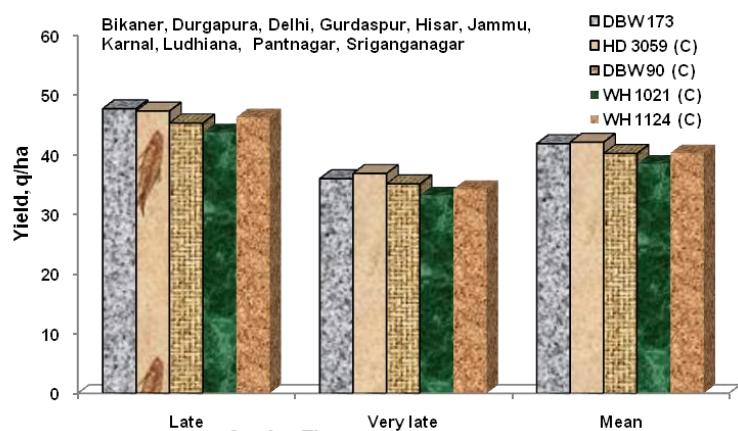

Figure 1. Genotypes under irrigated late and very late sown in NWPZ

NORTH EASTERN PLAINS ZONE

In this zone, one varietal evaluation trial was conducted to evaluate the performance new genotype HI 1612 against five checks under restricted irrigation timely sown conditions. The test genotype performed significantly better than the best check with a yield gain of 2.44% as compared to the best check K 1317 (Figure 2)

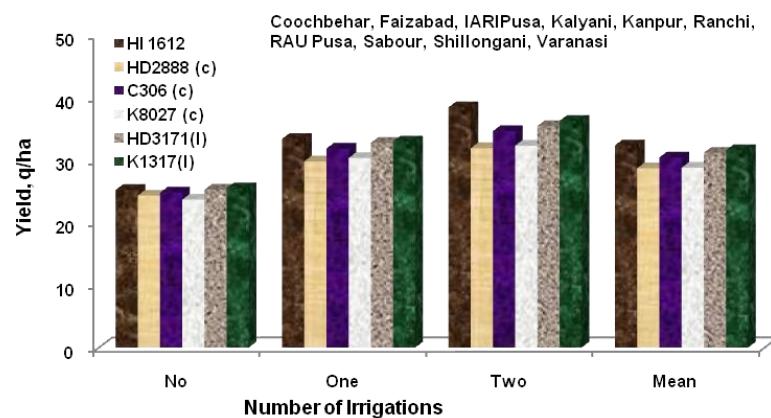

Figure 2. Genotypes under restricted irrigations in NEPZ

PENINSULAR ZONE

In this zone, two coordinated trials for evaluation of new genotypes for irrigated timely sown and rainfed conditions were conducted.

Irrigated Timely Sown

One test genotype (DBW 168) was evaluated against four checks (MACS 6478, MACS 6222, GW 322 and UAS 304) under two sowing conditions i.e. timely and late sown conditions at all the six locations. The pooled analysis revealed significant effect of sowing time and genotypes on grain yield. The test genotype DBW 168 ranked last among five genotypes in terms of grain yield (41.41 q/ha) as compared to the check varieties. The maximum grain yield was produced by check variety MACS 6478 (45.24 q/ha) followed by GW 322 (43.07 q/ha), MACS 6222 (42.33 q/ha) and UAS 304 (41.80 q/ha).

Rainfed Conditions

In this trial one *aestivum* (UAS 375) and two *durum* (HI 8777, MACS 4028) test entries were evaluated against two *aestivum* checks (NI 5439, NIAW 1415) and two *durum* checks (UAS 446, AKDW 2997-16) at three nitrogen levels (40, 60 and 80 kg/ha). The test entry UAS 375 gave numerically better yield than the respective best check NI 5439 with a yield gain of 4.15

percent (Figure 3). Both the durum test entries HI 8777, MACS 4028 were poorer than the respective best check UAS 446.

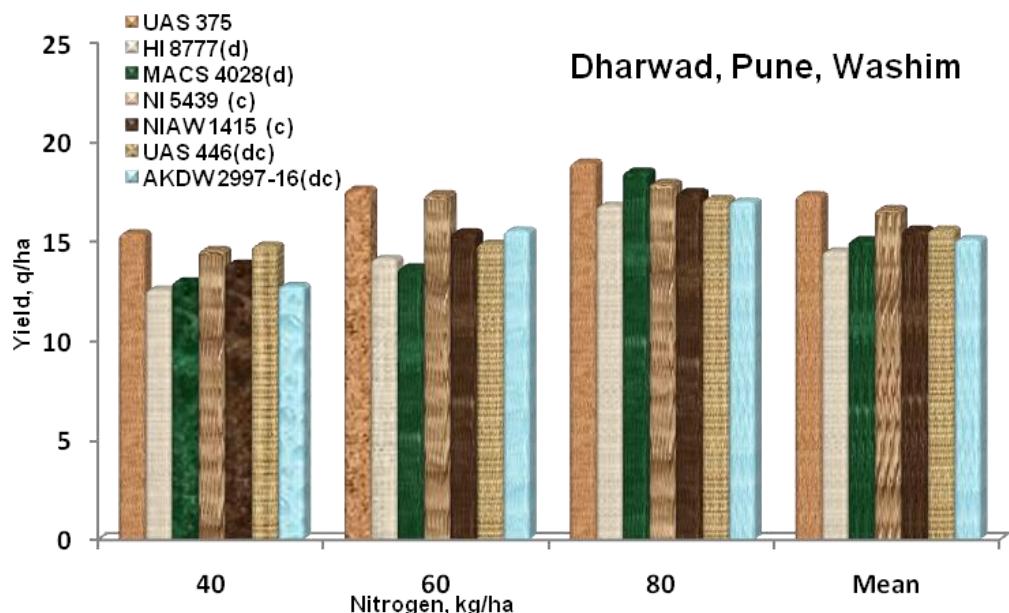

Figure 3. Genotypes under rainfed conditions in PZ

PRODUCTION TECHNOLOGIES

Various special coordinated trials on site specific nutrient management, tillage and nitrogen management, irrigation methods, spacing and nutrient management for maximising productivity were conducted to address various issues in different wheat growing zones. The results of various experiments on updating package of practices are summarised below;

SPL-1: Evaluation of herbicides for control of broadleaved weeds in wheat

This trial was conducted in five wheat growing zones (NHZ, NWPZ, NEPZ, CZ and PZ) to identify effective herbicides for control of broad leaved weeds in wheat. The trial was conducted in RBD with eleven weed control treatments replicated thrice. The treatments were i) *Halauxifen-methyl ester + Florasulam 40.85% WG + surfactant Polyglycol 26-2 N (12.76 g a.i.+750 ml./ha); ii) Metsulfuron methyl 20 WG + surfactant (4.0 g a.i.+625 ml./ha), iii) Carfentrazone 40DF (20.0 g a.i./ha); iv) 2,4-D Na 80 WP (500 g a.i./ha); v) 2,4-D E 38 EC (500 g a.i./ha); vi) Metsulfuron+carfentrazone +surfactant (4.0 g+20 g+625 ml/ha); vii) 2,4-D Na + Carfentrazone (400+20 g a.i./ha); viii) 2,4-D E + Carfentrazone (400+20 g a.i./ha); ix) Halauxifen methyl + florasulam+ carfentrazone + surfactant (10.21+20 g a.i.+750 ml /ha); x) Weedy check and xi) Weed free.* Broadleaved herbicides were applied at 30-35 days after sowing. A blanket dose of clodinafop 60 g/pinoxaden 50 g/fenoxyaprop 100 g/ha was applied about 5 days before or after the broad leaf herbicide application to control grassy weeds.

The trial was conducted at twenty locations i.e. four centres (Almora, Bajaura, Khudwani and Malan) in NHZ, seven centres (Durgapura, Gurdaspur, Hisar, Jammu, Karnal, Ludhiana and Pantnagar) in North Western Plains Zone, five locations (Coochbehar, Faizabad, Kalyani, Sabour and Varanasi) in North Eastern Plains Zone, three locations (Bilaspur, Indore and Udaipur) in Central Zone and one centre (Dharwad) in Peninsular Zone.

In all the zones weed free treatment produced the highest grain yield which was closely followed by the treatment having combination of Halauxifen methy + florasulam + carfentrazone + surfactant or Metsulfuron + Carfentrazone + S. Among broad leaved herbicides, Halauxifen methyl + florasulam + carfentrazone + surfactant (10.21 + 20 g a.i. + 750 ml/ha) was found the best treatment in controlling broad leaf weeds density and dry weight.

SPL-2: Management of lodging and yield maximization in wheat

This experiment was conducted to maximise wheat yield with target yield of 6 and 7 t/ha using crop growth regulators Chlormequat chloride (Lihocin) and Tebuconazole (Folicur 430 SC). In Northern Hills Zone, this experiment was conducted at Almora (UttaraKhand), Bajaura (Kullu, HP), Khudwani (Anantnag, J&K) and Malan (Palampur, HP). The pooled analysis showed that increasing fertiliser doses enhanced grain yield significantly (Figure 4). Application of 150% RDF has increased the grain yield (50.45 q/ha) to the tune of 10.0% over RDF (45.40 q/ha). Even 15 t/ha FYM application along with 150% RDF increased the grain yield (51.06

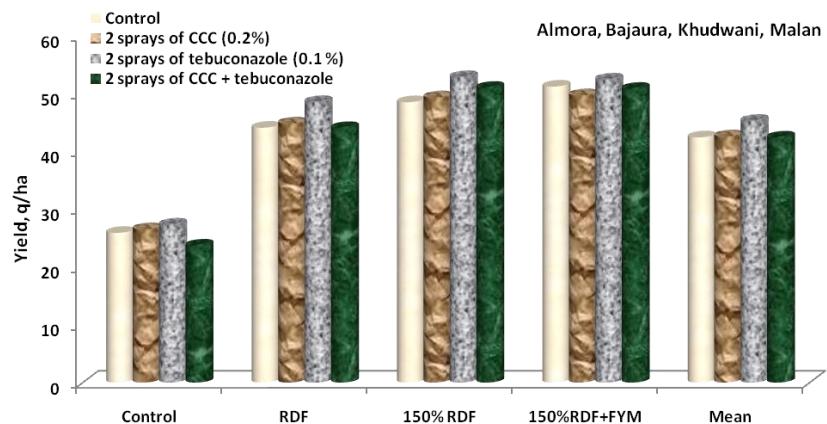

Figure 4. Maximising yield using nutrient management and growth regulators-NHZ q/ha) numerically as compared to 150% RDF application. Two spray of tebuconazole produced maximum grain yield (45.30 q/ha) which was significantly higher than other treatments. Application of CCC @ 0.2 % + tebuconazole @ 0.1 % twice in crop season reduced the plant height significantly as compared to other treatments.

In NWPZ this trial was conducted at seven centres namely at Agra, Durgapura, Hisar, Jammu, Karnal, Ludhiana and Panthagar. The pooled analysis showed significant effect of fertilizer application on grain yield and yield attributes (Figure 5). The grain yield enhanced significantly with increasing fertiliser doses. The application of 150 % RDF increased the grain yield (56.44 q/ha) to the tune of 2.7 % over RDF (54.95 q/ha). Also, the addition of 15 t/ha FYM application along with 150 % RDF increased the grain yield (58.17 q/ha) significantly as compared to 150 % RDF application. Two spray of Chlormequat chloride (Lihocin) 0.2 % + tebuconazole (Folicur 430 SC) 0.1% produced maximum grain yield

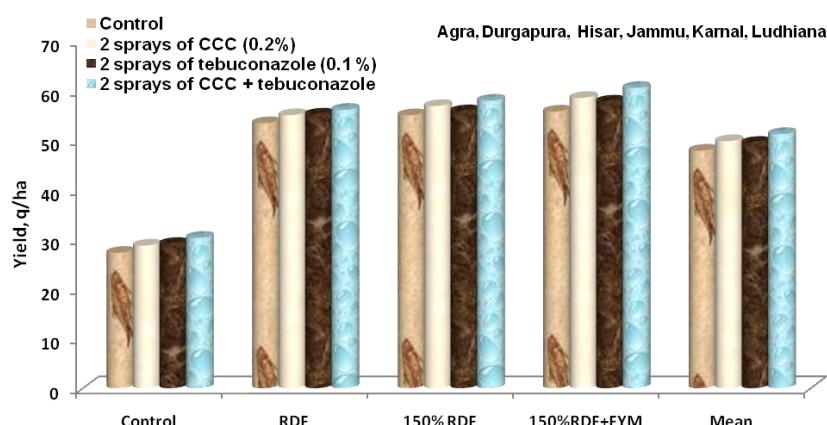

Figure 5. Maximising yield using nutrient management and growth regulators-NWPZ

(51.25 q/ha) which was significantly higher than other treatments. This showed that growth retardant in combination with fungicide tebuconazole is more effective rather alone application.

In NEPZ, this experiment was conducted at ten centres namely Burdwan, Coochbehar, Faizabad, Kalyani, Kanpur, Ranchi, RAU Pusa, Sabour, Shillongani and Varanasi. The pooled analysis showed that increasing fertiliser doses enhanced grain yield significantly (Figure 6). The trend was similar to the North Western Plains Zone and the highest yield (41.82 q/ha) was recorded with two spray of Chlormequat chloride (Lihocin) 0.2 % + tebuconazole (Folicur 430 SC) 0.1% which was significantly higher than other treatments.

In Central Zone, this trial was conducted at eight locations (Bilaspur, Gwalior, Indore, Jabalpur, Junagadh, Kota Udaipur and Vijapur). The highest yield was recorded under the treatment 150%RDF+FYM (53.07 q/ha) as compared to all other treatments (Figure 7). The treatments having two sprays of Lihocin and two sprays of Lihocin+Folicur were statistically at par whereas the treatment two sprays of Lihocin+Folicur (47.45 q/ha) was statistically higher than the treatment two sprays of Folicur (46.61 q/ha). Application of growth retardants reduced plant height drastically as compared to control. Minimum plant height was observed under two sprays of Lihocin (82.88 cm) followed by two sprays of Lihocin+Folicur (82.99 cm).

In Peninsular Zone this trial was conducted at Dharwad, Niphad, Pune and Ugar Khurd. The treatment with

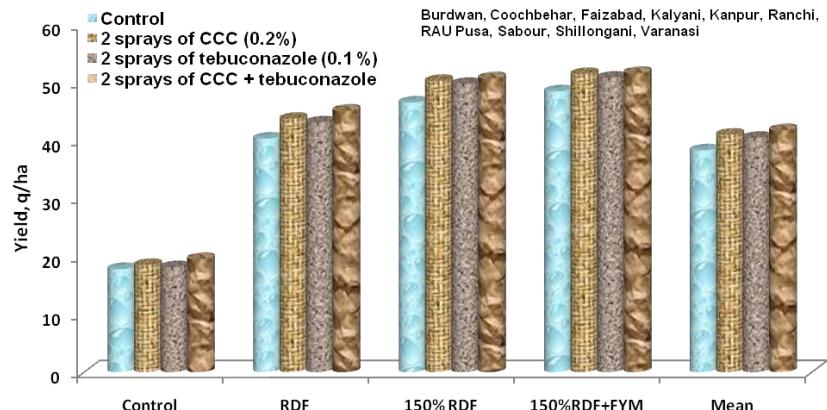

Figure 6. Maximising yield using nutrient management and growth regulators-NEPZ

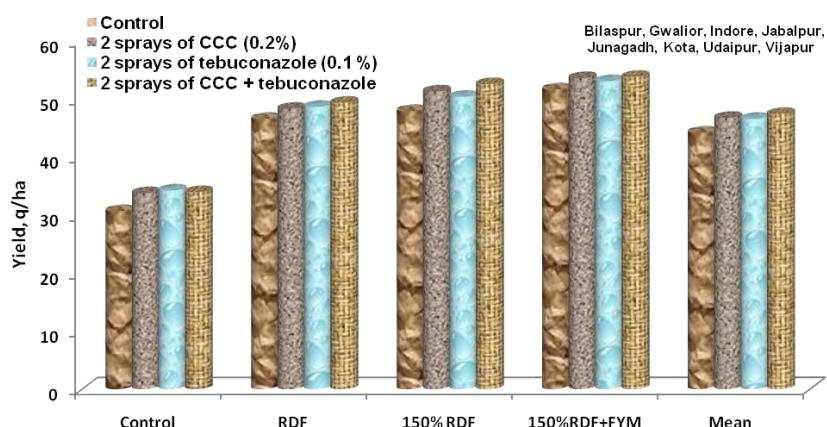

Figure 7. Maximising yield using nutrient management and growth regulators-CZ

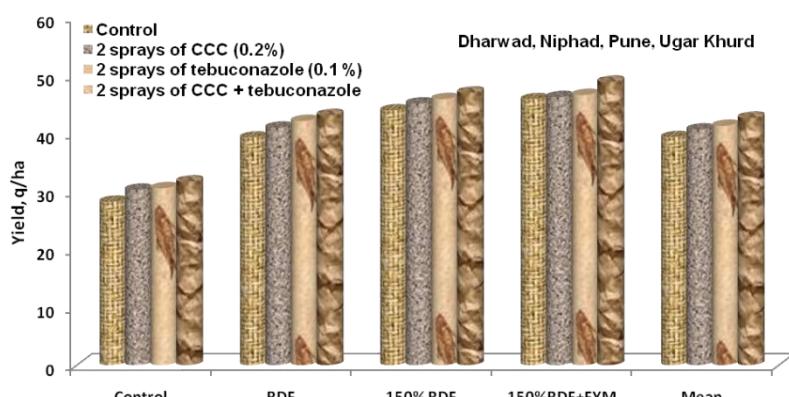

Figure 8. Maximising yield using nutrient management and growth regulators-PZ

150% RDF + 15 t/ha FYM produced maximum yield (46.94 q/ha) followed by 150 % RDF (45.53 q/ha) and both the treatments remained statistically at par (Figure 8). Among growth retardant treatments two sprays as tank mix Lihocin at 0.2% + Folicur 430 SC at 0.1% produced maximum yield (42.71 q/ha) followed by two sprays of Folicur 430 SC at 0.1% (41.31 q/ha) and remained statistically at par.

SPL-3: Efficient nutrient management in maize-wheat system

For efficient nutrient management in maize/soybean-wheat system an experiment was conducted at two locations (Dharwad, Niphad) in Peninsular Zone. There was significant effect of nutrient management on wheat equivalent yield of maize/soybean-wheat system (Figure 9). It was found that maximum wheat equivalent yield (131.63 q/ha) was obtained in maize-wheat system with 125% of recommended dose of fertilizers (RDF) for both the crops followed by RDF for 6.0 t/ha targeted maize and 4 t/ha targeted wheat yield (127.83 q/ha) which were at par. Almost similar trend was observed at both the centres.

Figure 9. Efficient nutrient management in maize/soybean-wheat system

SPL-4: Validation of leaf colour chart (LCC) for different wheat varieties

To validate the leaf colour chart for different varieties for higher nitrogen use efficiency an experiment was conducted in NHZ and NWPZ. The varieties used were HPW 349, VL 907 and HS 507 in NHZ and WH 1105, HD 2967 and DPW 621-50 in NWPZ.

In Northern Hill Zone, the trial was conducted at four centres (Almora, Bajaura, Khudwani and Malan). The application of 145 kg/ha nitrogen in treatment LCC -apply 55 kg N/ha if LCC<4 and 45 kg N/ha if LCC ≥4 recorded the highest yield (45.78 q/ha) which was significantly higher than all other treatments (Figure 10) except N rich (225 kg N/ha) treatment (45.19 q/ha). In addition, the nitrogen saving in this treatment was about 3.3%. The varietal effect was not significant and all the varieties behaved similarly.

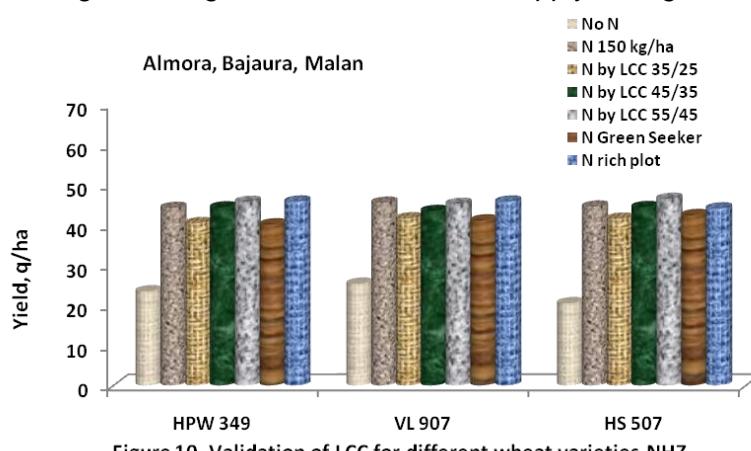

Figure 10. Validation of LCC for different wheat varieties-NHZ

In North Western Plains Zone, the trial was conducted at six centres (Agra, Durgapura, Hisar, Jammu, Ludhiana and Pan Nagar). The data of two centres where Green seeker treatment was

not implemented were pooled separately. The highest mean yield of 60.92 q/ha was recorded in N rich plots, where 225 kg/ha N was applied followed by RDF (Figure 11). In comparison to RDF, LCC based N application (55 kg N/ha if LCC<4 and 45 kg N/ha if LCC \geq 4) produced similar yield. Among genotypes WH 1105 produced marginally higher yield compared to DPW 621-50 and HD 2987. The highest yield (63.77 q/ha) was obtained with WH 1105 when N was applied at 225 kg/ha. Under no fertilizer application, mean wheat yield obtained was 33.63 q/ha.

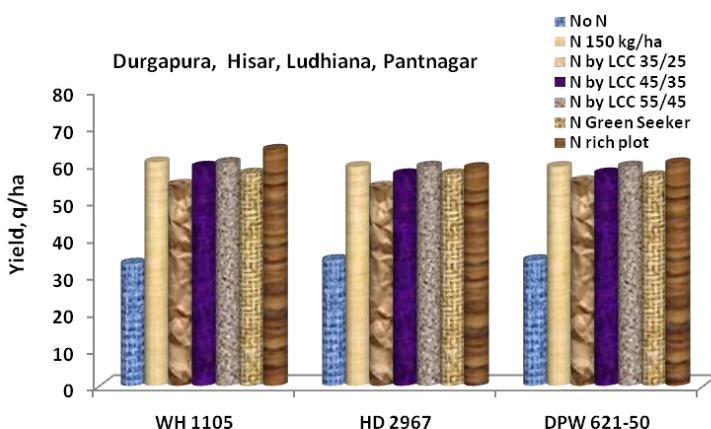

Figure 11. Validation of LCC for different wheat varieties-NWPZ

SPL-5: Efficient water management in wheat using micro-irrigation

Water management is the key issue for economising the irrigation water use efficiency of wheat crop. To optimize the water requirement for yield maximisation in wheat, a special coordinated trial was planned and conducted under irrigated timely sown conditions at three locations *i.e.* Durgapura and Karnal in NWPZ and Vijapur in CZ.

In NWPZ, the highest yield (57.10 q/ha) was recorded in drip irrigation at 100% PE, which was significantly higher than other irrigation treatments except six irrigations at critical growth stages (Figure 12). Maximum water use was in sprinkler at 100% PE (430.5 mm) followed by check basin irrigation system (396.3 mm).

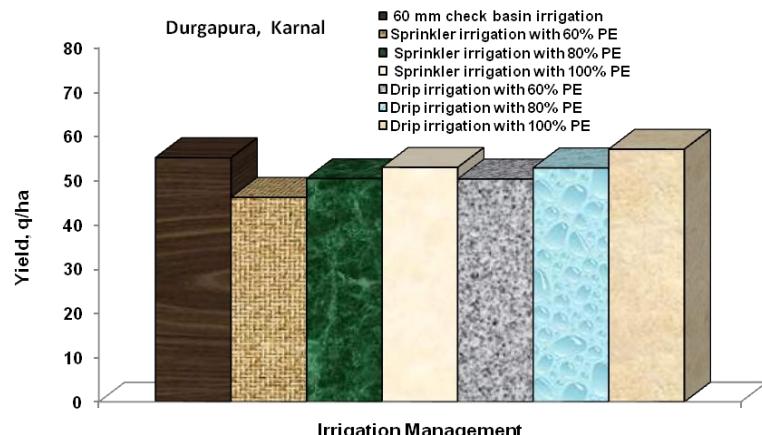

Figure 12. Micro-irrigation for efficient water management in wheat-NWPZ

In Central Zone, seven irrigation treatments followed were 60 mm check basin irrigation at critical growth stages (CRI, T, JT, BL, M and D), drip irrigation with 60%, 80% and 100% PE at 3 days interval, drip irrigation at 0.8, 1.0 and 1.2 IW/CPE *i.e.* 50 mm irrigation when cumulative Pan Evaporation (CPE) reaches 60 mm, 50 mm and 40 mm, respectively. The results presented in Figure 13 showed highest yield in drip irrigation at 1.2 IW/CPE (45.44 q/ha) followed

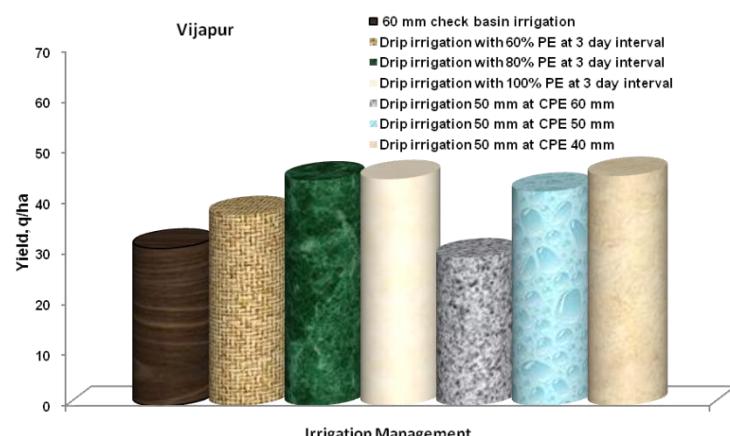

Figure 13. Micro-irrigation for efficient water management in wheat-CZ

by drip irrigation with 100% PE (44.81 q/ha). Maximum water use was in 60 mm check basin irrigation treatment (420 mm).

SPL-6: Evaluation of Pusa Hydrogel and herbal Hydrogel on in situ moisture conservation under different irrigation levels in wheat

To improve the water use efficiency and wheat productivity a special coordinated trial was conducted. The trial was conducted at four locations in NWPZ i.e. Durgapura, Karnal, Ludhiana, Pan Nagar and one location each in CZ (Junagarh) and PZ (Pune). The effect of irrigation and hydrogel was significant on wheat productivity but their interactions were not significant. On mean basis, significantly highest yield (59.52 q/ha) was recorded where six irrigations were applied at critical growth stages of wheat. There was significant yield improvement with application of hydrogel (Figure 14) but the difference among hydrogels was not significant. At Junagarh in Central Zone and at Pune in Peninsular Zone, the effect of hydrogel was not significant.

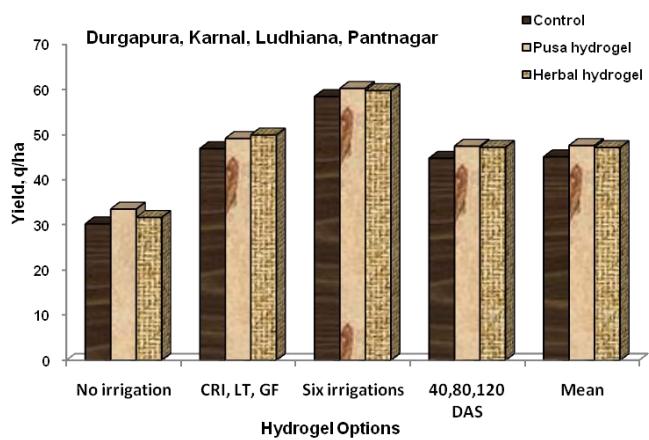

Figure 14. Performance of hydrogel in wheat-NWPZ

SPL-7: Wheat yield maximization under different tillage options

To identify the effective varieties for Conservation Agriculture system an experiment was conducted at four locations (Hisar, Karnal, Ludhiana and Pan Nagar) in NWPZ. Six timely sown varieties namely WH 1105, HD 2967, DPW 621-50, DBW 88, HD 3086 and PBW 550 were evaluated in CT and CA system. This experiment was under rice-wheat system except Hisar centre where cotton-wheat system was adopted. The effect of tillage options and varieties as well as their interactions were non-significant (Figure 15).

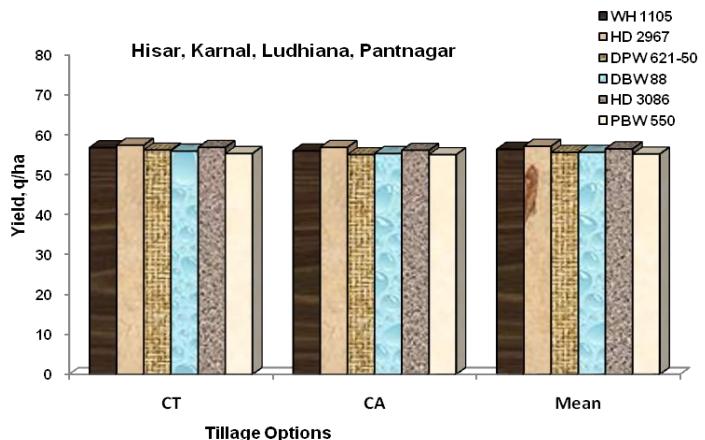

Figure 15. Wheat varieties under conservation agriculture (CA)-NWPZ

SPL-8: Control of pre-harvest sprouting (PHS) in wheat

To control pre harvest sprouting in wheat, three chemicals (NaCl, paraquat and Na molybdate) with different doses were tried in two varieties (CBW 38 and K 0307) at Coochbehar and Shillongani. The trial at Shillongani centre failed because the crop was damaged by rain leading to pre-harvest sprouting and yield could not be recorded. The effect of varieties as well as of chemical spray was not significant.

SPL-9: Effect of mulch with irrigation

The trial was conducted at Coochbehar and Shillongani centres in the NEPZ. The grain yield recorded in bed planting (34.72 q/ha) and conventional tillage (34.25q/ha) was at par grain but significantly higher than zero tillage (29.67 q/ha). Rice straw mulch application at 0, 1, and 3 irrigations recorded significantly higher grain yield than their respective counterpart without mulch application (Figure 16). Maximum grain yield (42.75 q/ha), earhead/m² (317), grains/earhead (36.00) and thousand grains weight (39.10) were obtained with straw mulch at 3 irrigation application which were significantly higher than other treatments.

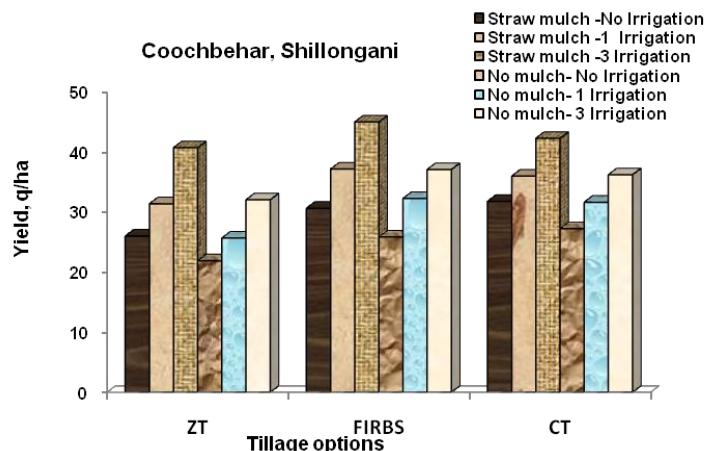

Figure 16. Tillage, irrigation and mulching effect on wheat -NEPZ

SPL-10: Mulching to mitigate the climate change effect

This experiment was conducted in three zones (NWPZ, NEPZ and CZ) with the aim to mitigate the terminal heat effect using straw mulch and organic manure as well as the chemical sprays ($ZnSO_4$ and KCl).

In NWPZ, the pooled analysis (Figure 17) showed that timely sowing (62.29 q/ha) produced significantly higher grain yield than late sowing (46.93 q/ha). Delaying wheat sowing reduced the grain yield by 24.7 %. The reduction in yield was due to reduction in earhead density and grain weight. Application of 0.2 % KCl produced numerically higher grain yield (55.47 q/ha) than all other treatments. Application of FYM (10 t/ha) along with recommended fertiliser recorded higher grain yield (55.21 q/ha) than RDF alone (53.09 q/ha).

In NEPZ, timely sowing (44.50 q/ha) produced significantly higher grain yield (Figure 18)

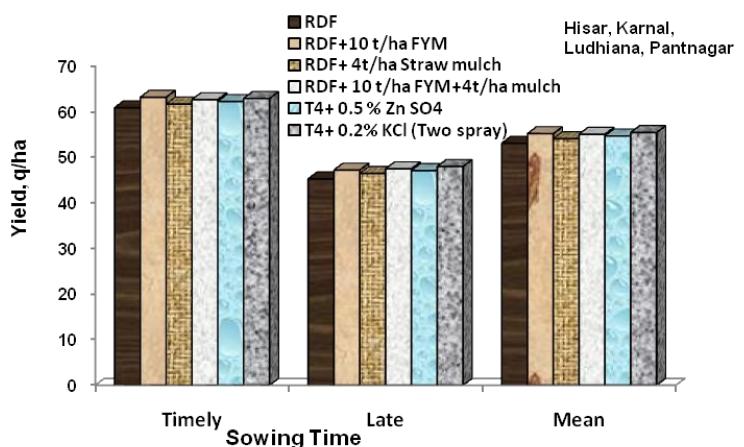

Figure 17. Organic manure and mulch on wheat yield in NWPZ

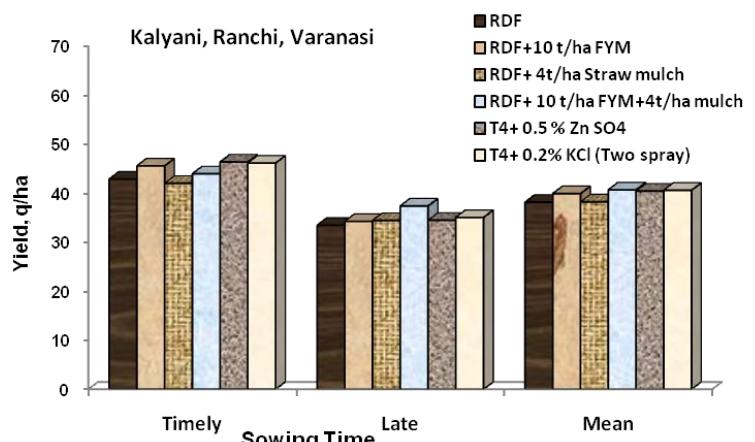

Figure 18. Organic manure and mulch on wheat yield in NEPZ

than late sowing (34.84 q/ha). Delaying wheat sowing reduced the grain yield by 21.7 %. Maximum grain yield was obtained at recommended dose of fertiliser along with FYM and mulch application (40.68 q/ha) followed by this treatment in combination with KCl (40.60 q/ha) and $ZnSO_4$ (40.43 q/ha) application.

In Central Zone, this experiment was conducted at Udaipur centre only. The data presented in Figure 19 showed that timely sowing yielded significantly higher (53.47 q/ha) as compared to late sowing (44.80 q/ha). Delay in wheat sowing reduced the grain yield by 16.2%. Application of recommended fertiliser along with FYM, mulch and 0.2% KCl produced highest mean yield (51.43 q/ha) which was at par with RDF+Mulch+FYM with and without 0.5% $ZnSO_4$ application.

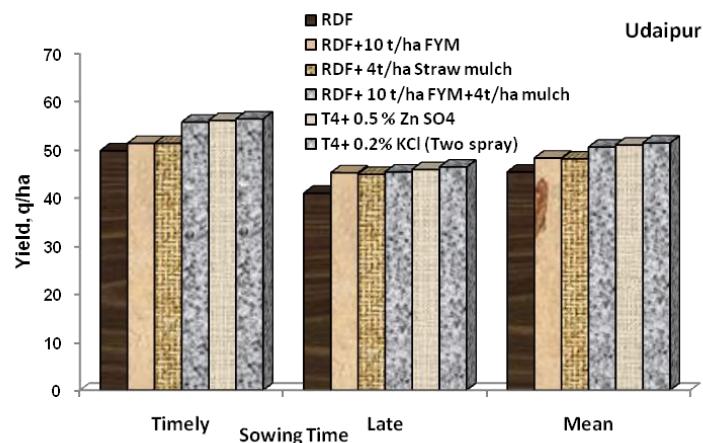

Figure 19. Organic manure and mulch on wheat productivity in CZ

SPL-11: Comparative performance of line versus dibbling in wheat

In Central Zone, this trial was conducted to evaluate the effect of planting options and spacing on wheat productivity at eight locations (Bilaspur, Gwalior, Indore, Jabalpur, Junagarh, Kota, Powarkheda and Udaipur). The highest yield was obtained in dibbling 15x15 cm (50.13 q/ha) followed by line sowing @ 20 cm with seed rate of 100 kg/ha (49.54 q/ha) but the differences were not significant. The increment in yield may be attributed to higher number of earheads/sq. m. The other planting options recorded significantly lower yield as compared to these two methods. The cultivar HI 8737 yielded significantly higher (47.91q/ha) as compared to HI 1544 (46.43 q/ha).

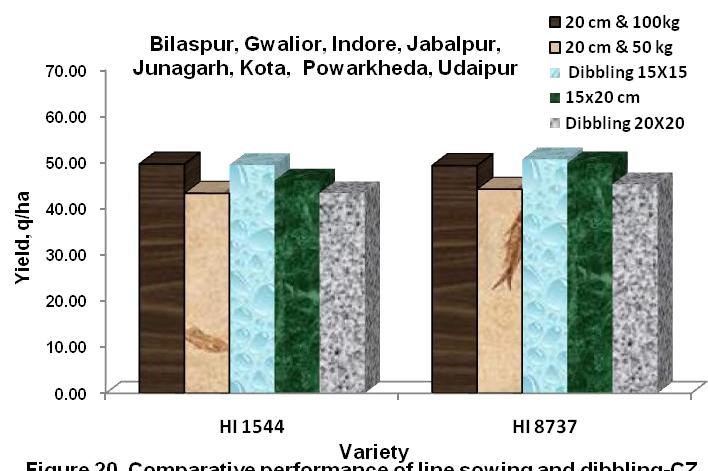

Figure 20. Comparative performance of line sowing and dibbling-CZ

In Peninsular Zone this trial was conducted at three locations (Akola, Dharwad and Niphad). The highest yield was obtained in line sowing at 20 cm spacing with seed rate of 100 kg/ha (46.63 q/ha) followed by dibbling at 15x15 cm (43.18 q/ha) and remained at par (Figure 21). Both the cultivars were statistically at par with UAS 304 giving marginally higher yield (40.30 q/ha) as compared to NIAW 301 (38.77 q/ha).

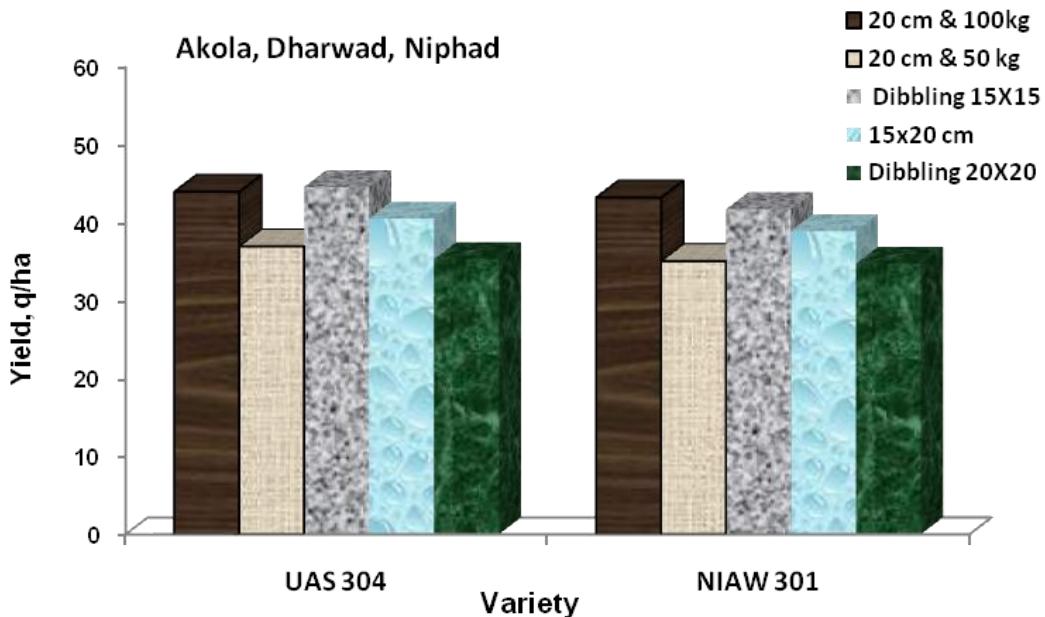

Figure 21. Comparative performance of line sowing and dibbling-PZ

SPL-12: Precision nutrient management and validation of Nutrient expert in wheat

This experiment was conducted with seven fertiliser doses combination viz. control, Recommended Dose of Fertilizers (RDF), 150 % RDF, 150 % PK, 150 % NK, 150 % NP and nutrient expert in RBD at three locations (Almora, Bajaura and Malan) in NHZ, four location at NWPZ (Hisar, Karnal, Ludhiana, Panthagar), one location each in NEPZ (Varanasi), CZ (Udiapur and PZ (Dharwad).

In NHZ, 150% RDF gave maximum and significantly higher grain yield (49.59 q/ha) and biomass (118.69 q/ha) as compared to other treatments (Figure 22). This was followed by nutrient expert treatment which

was at par with 150% RDF and produced almost 6.45% higher grain yield than recommended dose of fertiliser (RDF) application. Omission of phosphorus and potash had marginal effect on productivity but the omission of nitrogen drastically reduced the productivity. This indicates that the nutrient recommendation for the northern hills needs a relook for achieving higher productivity. The targeted yield level of 6 t/ha could not be achieved and the yield level in nutrient expert was only 4.6 t/ha.

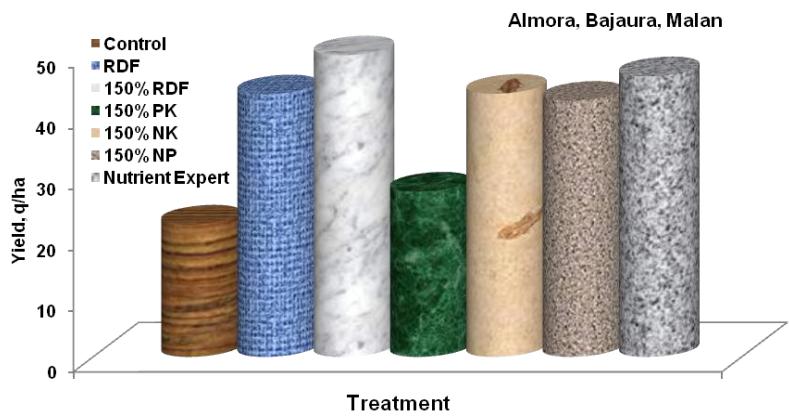

Figure 22. Validation of Nutrient expert in wheat-NHZ

In NWPZ, highest grain yield was recorded with 150 % RDF (61.45 q/ha) which was at par with recommended fertilizer and nutrient expert treatments (Figure 23). The 150% RDF application

produced almost 3% higher grain yield than recommended dose of fertiliser (RDF) application. The targeted yield of 7 t/ha using nutrient expert could not be achieved even after applying more than recommended NPK and the yield level was almost similar.

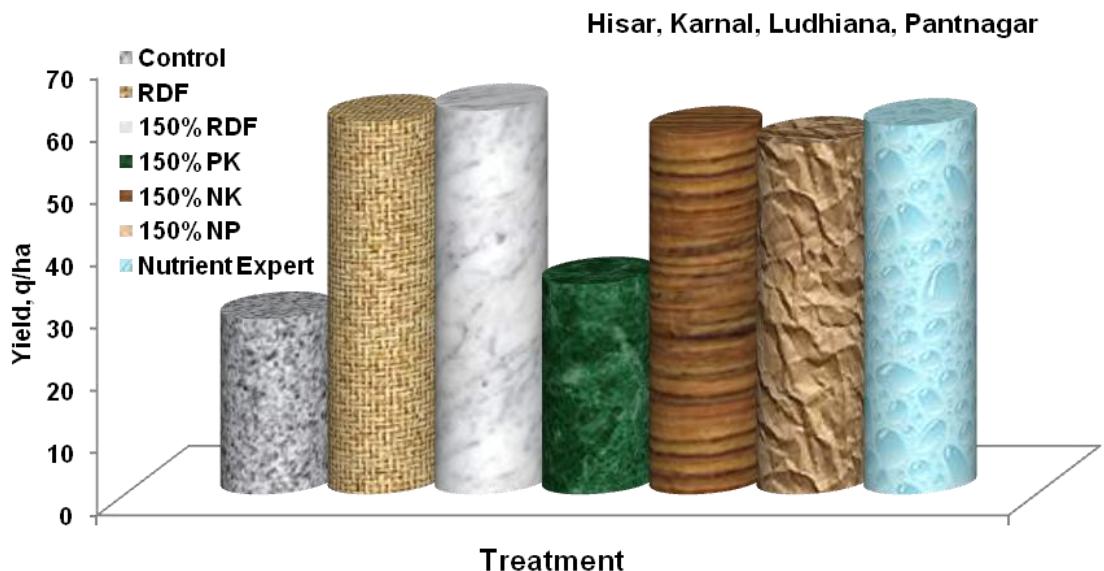

Figure 23. Validation of Nutrient expert in wheat-NWPZ

In NEPZ, this experiment was conducted at Varanasi centre only. The data revealed that 150% RDF recorded maximum and significantly higher grain yield (59.34 q/ha) as compared to other treatments (Figure 24). This was followed by 150% NP and NK applications. 150% RDF application produced almost 10.8 % higher grain yield than recommended dose of fertiliser (RDF) application. Nutrient expert based application for targeted yield of 6 t/ha produced significantly lower grain yield (48.42 q/ha) than RDF which seems mainly due to lower nitrogen calculation using nutrient expert.

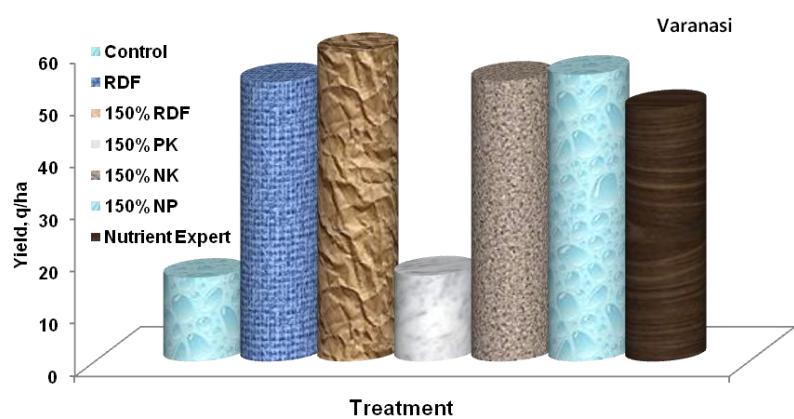

Figure 24. Validation of Nutrient expert in wheat-NEPZ

In Central Zone, the highest yield was obtained under Nutrient Expert treatment reaching 55.08 q/ha (Figure 25) followed by 150% RDF (53.38 q/ha) despite higher nutrient application compared to nutrient expert except potash. However, the targeted yield of 6 t/ha could not be achieved despite about 42% higher nitrogen, 10% higher phosphorus and 90% higher potash. The Nutrient Expert treatment also recorded highest biomass (130.22 q/ha).

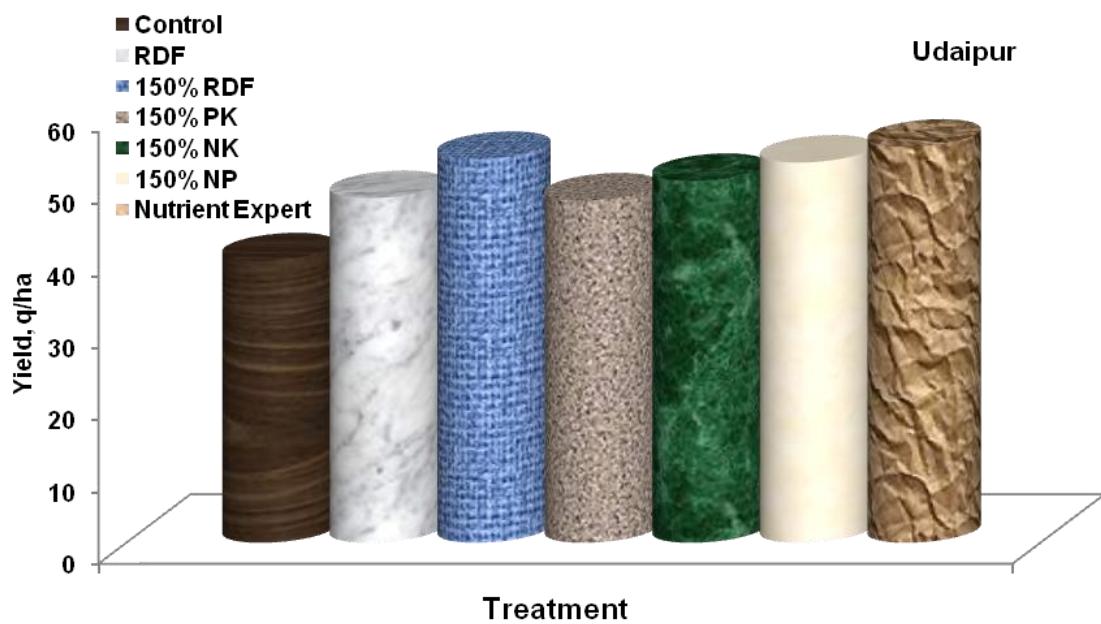

Figure 25. Validation of Nutrient expert in wheat-CZ

At Dharwad centre of Peninsular Zone, the highest yield was obtained under Nutrient Expert treatment with a yield level of 45.15 q/ha (Figure 26) followed by 150% of RDF (42.32 q/ha) and RDF (40.32 q/ha). The yield by nutrient expert was not significantly higher than recommended dose of fertilizers (40.32 q/ha) although the nutrient application was higher (about 16% N, 8% phosphorus and almost 50% more potash) than recommended doses of fertilisers. The yield obtained in nutrient expert treatment was the highest but was much below the targeted yield of 6 t/ha.

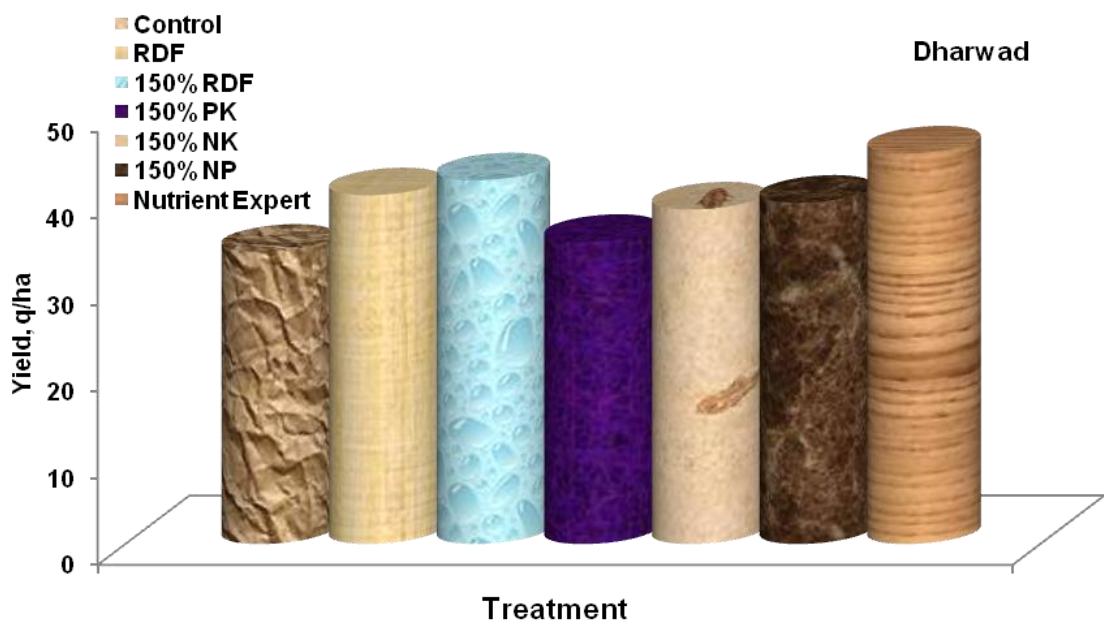

Figure 26. Validation of Nutrient expert in wheat-PZ

Coordinated Trials

Northern Hills Zone

The Northern Hills Zone represents Himachal Pradesh, parts of Jammu & Kashmir, Uttrakhand and North Eastern Hills. The six centres namely Almora, Bajaura, Imphal (Manipur), Khudwani (Anantnag), Malan (Palampur) and Shimla are engaged in wheat research under All India Coordinated Wheat and Barley Improvement Project. The soil data received from four centres (Almora, Bajaura, Khudwani and Malan) are presented in Annexure III. The texture at all the four centres varied from silty clay loam to silty clay and inceptisols. Imphal and Shimla centres did not conduct trials for their centre. The organic carbon content range of Almora, Bajaura, Khudwani and Malan centres was 1.02-1.09, 0.60-0.62, 1.01-1.20 and 0.60-0.80 per cent, respectively, with low to medium in nitrogen and medium to high in phosphorus and potash contents. The data on meteorological parameters received from various centres has been reported in Annexure II. The rainfall was well distributed at all the locations for which data were received and the highest rainfall of 366.2 mm was recorded at Bajaura during the crop growing period followed by 278.7 mm at Malan, 179.8 mm at Almora and 148.1 mm at Khudwani (Anantnag) from October, 2016 to May, 2017. The minimum and maximum temperatures were -1.6°C and 32.9°C at Almora, -2.3°C and 32.7°C at Bajaura, -6.0°C and 29.3°C at Khudwani, 5.4°C and 34.6°C at Malan, respectively.

Since, there was no new genotype in the final year of varietal evaluation, therefore coordinated trials to evaluate the performance of wheat genotypes under different growing conditions were not formulated and conducted.

North Western Plains Zone

The North Western Plains Zone consists of the states of Haryana, Punjab, Delhi, western UP, northern parts of Rajasthan, Jammu area of J&K and plains of Himachal and Uttarakhand. Twelve centres in this zone namely Agra, Bikaner, Delhi, Durgapura, Gurdaspur, Hisar, Jammu, Karnal, Ludhiana, Nagina, Pantnagar and Sriganganagar are actively engaged in wheat research activities under All India Coordinated Wheat and Barley Improvement Project (AICW&BIP). The data on various meteorological and soil parameters for various centres are given in Annexure-II and Annexure-III, respectively. Soils of this zone are sandy loam to clay loam. The soil organic carbon at various locations varied from 0.28% at Durgapura to 0.71% at Pantnagar. Soils of this zone are generally low in available nitrogen, medium to high in available phosphorus and available potash. However, at Gurdaspur, available Potash was 80 kg/ha. During the growing season, the maximum rainfall was received at Jammu (239 mm), followed by Gurdaspur (171.8 mm), Delhi (104.1 mm), Karnal (95.6 mm), Ludhiana (74 mm), Pantnagar (79.2 mm), Nagina (63 mm), Hisar (49.7 mm), and Durgapura (35.8 mm). The weekly mean maximum and minimum temperatures at different locations were 39.5 & 4.2°C at Delhi, 42.1 & 5.7°C at Durgapura, 40.3 & 3.3°C at Gurdaspur, 42.9 & 3.2°C at Hisar, 38.8 & 2.4°C Jammu, 40.4 & 5.0 °C at Karnal, 38.9 & 4.9°C at Ludhiana, 33.1 & 2.5 at Nagina and 38.1 & 6.5°C at Pantnagar, respectively, during November 2016 to April 2017. In this zone one coordinated trial was conducted to evaluate second year genotypes for late sown conditions at various locations.

EVALUATION UNDER DIFFERENT SOWING CONDITIONS

The performance of one test genotype was evaluated for late sown irrigated conditions at different locations and the results are summarized here under;

Irrigated Late Sown

The test genotype, DBW 173, was evaluated against four checks (HD 3059, DBW 90, WH 1021, WH 1124) at twelve centres *i.e.* Agra, Bikaner, Delhi, Durgapura, Gurdaspur, Hisar, Jammu, Karnal, Ludhiana, Nagina, Pantnagar and Sriganganagar under late and very late sown conditions. The late sowing was from 10th to 16th December and the very late sowing was from 1st January to 7th January. The trial was laid out in a split plot design with sowing time in main and genotypes in sub plots with three replications. The sowing was done using the normalized (adjusted considering 1000 grains weight of 38 g) seed rate of 125 kg/ha at a row-to-row spacing of 18 cm. Nitrogen (120 kg/ha) was applied in three splits (1/3 at sowing and remaining 2/3 nitrogen as 1/3rd at first irrigation *i.e.* at 20-25 days after sowing and 1/3rd at second irrigation *i.e.* 40-45 days after sowing), whereas full phosphorus (60 kg P₂O₅/ha) and potash (40 kg K₂O/ha) were applied as basal.

The pooled analysis of data from ten centres is presented in Table 2.1 and the centre wise data are reported in Annexure-I as Table 2.1.1 to 2.1.10. The data from Agra and Nagina were not considered due to improper time of sowing. The perusal of data indicates that there was a significant decline in yield from 46.14 q/ha to 35.13 q/ha when sowing was delayed from late to very late sown conditions because of significant reduction in number of earheads/m², and 1000 grains weight. The average yield decline due to delayed sowing was 23.9 per cent. On an average basis, the check variety HD 3059 produced the maximum grain yield (42.15 q/ha) followed by the test genotype DBW 173. The test genotype yielded at par to the best check HD 3059 and both these had significantly higher yield than other check varieties. The highest earhead/m², grains/earhead and 1000 grains weight were observed in WH 1124 (C), HD 3059(C) and DBW 173, respectively. Interaction between genotype and sowing time was non-significant for yield and yield attributes. The centre wise data on yield and yield attributes are presented in Tables 2.1.1 to 2.1.12 in Annexure-I.

North Eastern Plains Zone

The North Eastern Plains Zone (NEPZ) is the second most important wheat growing zone of the country consisting of Assam, Bihar, Jharkhand, Orissa, eastern parts of UP and West Bengal. In all eleven centres namely Burdwan, Coochbehar, Faizabad, IARI Pusa, Kalyani, Kanpur, Ranchi, RAU Pusa, RAU Sabour, Shillongani and Varanasi are actively involved in coordinated research activities. Soils of this zone are sandy loam to clay loam having organic carbon contents varying from 0.39 per cent at Varanasi to 1.12 per cent at Shillongani. The soils of this zone are low in available nitrogen, medium in available phosphorus and potash. Wheat production and productivity in this zone is more dependent on weather conditions during the crop season. The temperature is an important factor affecting the wheat productivity. Rainfall received varied from 5.1 mm at Varanasi to 415.7 mm at Shillongani during the wheat season of 2016-17. The rainfall was the highest at Shillongani (415.7 mm) followed by Burdwan (206.7 mm), IARI Pusa (197.4 mm), RAU Pusa (197.4 mm), Kanpur (69.4 mm), Sabour (53.9 mm), Faizabad (51.8 mm), Ranchi (29.4 mm), Coochbehar (17.0 mm), Kalyani (19.3 mm) and Varanasi (5.1 mm). The maximum and minimum temperatures at different locations were 43.3 °C and 8.0 °C at Burdwan, 34.7°C and 8.06°C at Coochbehar, 37.8°C and 4.9°C at Faizabad, 36.7 °C and 6.2 °C at IARI Pusa, 37.2°C and 8.8°C at Kalyani, 39.8°C and 5.9°C at Kanpur, 40.5°C and 3.5°C at Ranchi, 36.6 °C and 6.2 °C at RAU Pusa, 36.8°C and 6.0°C at Sabour, 34.8°C and 8.5°C at Shillongani and 40.1°C and 8.2°C at Varanasi, respectively.

EVALUATION UNDER DIFFERENT SOWING CONDITIONS

The performance of one test genotype was evaluated under restricted irrigation conditions at different locations and the results are summarized here under;

Restricted Irrigation

In this trial, one test entry HI 1612 and five checks (HD 2888, C 306, K 8027, HD 3171 and K 1317) were evaluated at no irrigation, one irrigation (CRI stage) and two irrigations (CRI and boot stage) in split plot design and replicated thrice. Main plots comprised of irrigation level and the genotypes were in the sub plots. The trial was conducted at ten locations (Coochbehar, Faizabad, IARI Pusa, Kalyani, Kanpur, Ranchi, RAU Pusa, Sabour, Shillongani and Varanasi). Full dose NPK (90:60:40) was applied as basal in no irrigation treatment and 1/3rd nitrogen, full phosphorus (60 kg P₂O₅/ha) and potash (40 kg K₂O/ha) was applied at the time of sowing and remaining N was top dressed at 1st node stage in other two main plots. Weed control measures were followed as per the recommended practice. The normalized seed rate used was 100 kg/ha (considering the 1000 grains weight of 38 g). Centre wise data are given in Annexure I as Tables 3.1.1 to 3.1.10.

The pooled analysis presented in Table 3.1 showed that increasing number of irrigations successively gave significantly higher grain yield. One and two irrigation application gave 28.47 % and 40.50 % higher grain yield, respectively than no irrigation. All the yield attributing parameters were significantly increased as level of irrigation enhanced. So, the yield increase was due to cumulative effect of all the yield attributing parameters. Test entry HI 1612 ranked 1st and produced significantly higher grain yield (32.31 q/ha) than other varieties. This entry also ranked first in number of grains/earhead (31.88). Second ranking was identified variety K 1317 in terms of grain yield (31.54 q/ha) whereas it ranked first in terms of earhead/m² (253) and thousand grain weight (42.31 g) as compared to other genotypes.

Central Zone

In the Central zone, nine centres, *viz.* Bilaspur, Gwalior, Indore, Jabalpur, Junagadh, Kota, Powarkheda, Udaipur and Vijapur are actively involved in the coordinated wheat programme. The data on soil and various meteorological parameters have been reported under Annexure II and Annexure III, respectively. Vertisols are primarily found in this zone and these soils vary between sandy loam, sandy clay loam to clay loam in texture. The organic carbon in these soils ranges between 0.31 to 0.8 per cent. Soils of this region are neutral in reaction, medium to high in available nitrogen (162.0 to 326.0 kg N/ha), low to high in phosphorus (12.35 to 41.16 kg P/ha) and high potash content (200 to 456.8 kg K/ha). Majority of rainfall received was in the month of October, and few showers were also received during later stages (January and February) of the crop season. The maximum rainfall received was 71.5 mm at Vijapur followed by 62.6 mm at Udaipur, 45.1 mm at Bilaspur, 43.6 mm at Jabalpur and 8.6 mm at Kota. Indore (2.4 mm) and Gwalior (0 mm) almost recorded nil precipitation. The average maximum and minimum temperatures recorded were 31.1°C and 15.2°C at Bilaspur, 30.3°C and 12.5°C at Gwalior, 30.7°C and 13.5°C at Indore, 31.0°C and 12.4°C at Jabalpur, 29.5°C and 12.4°C at Kota, 30.0°C and 12.3°C at Udaipur and 32.7°C and 16.2°C at Vijapur, respectively.

Since, there was no new genotype in the final year of varietal evaluation, therefore coordinated trials to evaluate the performance of wheat genotypes under different growing conditions were not formulated and conducted.

Peninsular Zone

In Peninsular zone six centres (Akola, Dharwad, Niphad, Pune, Ugar Khurd and Washim), are actively engaged in research activities of coordinated wheat agronomy programme. The data of climatic and soil parameters received from the centres are reported in Annexure II and Annexure III, respectively. The soils of this zone fall under the order vertisols and predominantly clayey in nature with low to high organic carbon ranging from 0.39 to 0.65 per cent. The available soil nitrogen is low ranging between 147 to 272 kg/ha, phosphorus from low to high (9.76 to 41 kg/ha) whereas the potash content in soil was very high (259 to 419 kg/ha). The water is a limiting factor in this zone and productivity is mainly dependent on rainfall and also the temperature during the crop growing cycle (November to April). Majority of rainfall received was in the month of October-November, and some rainfall was received during later stages in the crop season. The maximum rainfall received was 116 mm at Washim followed by 80.2 mm at Niphad, 50.8 mm at Dharwad, 29 mm at Pune, 12 mm at Akola and 7 mm at Ugar Khurd. The weekly average maximum and minimum temperatures were varied from 27.3-36.4 and 8.4-24.5°C at Akola, 27.3-36.9 and 11.6-20.20°C at Dharwad, 26.0-39.6 and 6.5-22.3 °C at Niphad, 28.2-39.9 and 7.9-20.7°C at Pune, 31.12-41.0 and 11.37-21.66°C at Ugar Khurd and 25.3-34.9 and 15.1-24.7°C at Washim, respectively.

EVALUATION UNDER DIFFERENT GROWING CONDITIONS

Two coordinated trials for evaluation of new genotypes for irrigated timely sown and rainfed conditions were conducted in this zone.

Irrigated Timely Sown

In this trial, one test genotype (DBW 168) was evaluated against four checks (MACS 6478, MACS 6222, GW 322 and UAS 304) under two sowing conditions *i.e.* timely and late sown conditions at all the six locations namely Akola, Dharwad, Niphad, Pune, Ugar Khurd and Washim. This trial was conducted in split plot design with sowing time in main plots and genotypes in the sub plots. The sowing was done using the normalized seed rate @ 100 kg/ha (adjusted considering 1000 grains weight as 38 g) at a row to row spacing of 20 cm. NPK fertilizers were applied @ 120:60:40 kg N, P₂O₅ and K₂O with 1/3 N, full P and K as basal application and the remaining 2/3 N as 1/3rd at first irrigation *i.e.* at 20-25 days after sowing

and 1/3rd at second irrigation i.e. 40-45 days after sowing. Irrigation and weed control measures were followed as per recommended package of practices for the zone.

Centres: Akola, Dharwad, Niphad, Pune, Ugar Khurd, Washim						

The pooled analysis of data from six centres reveals significant effect of sowing time and genotypes on grain yield (Table 5.1). On average basis, timely sown produced 44.14 q/ha

which is significantly higher than late sown conditions (41.40 q/ha). The gain in grain yield may be attributed to significantly higher earheads/sq. m. and thousand grain weights. The test genotype DBW 168 ranked last among five genotypes in terms of grain yield (41.41 q/ha) as compared to the check varieties. The maximum grain yield was produced by check variety MACS 6478 (45.24 q/ha) followed by GW 322 (43.07 q/ha), MACS 6222 (42.33 q/ha) and UAS 304 (41.80 q/ha). The variety MACS 6478 having maximum yield also produced significantly higher earheads (341/sq.m.) and thousand grains weight (42.18 g). The lesser yield in test entry DBW 168 might be due to lesser thousand grain weight and grains/earhead compared to check varieties. The centre wise data are presented in Annexure-I in Tables 5.1.1 to 5.1.6.

Rainfed Conditions

In this trial one *aestivum* (UAS 375) and two *durum* (HI 8777, MACS 4028) test entries were evaluated against two *aestivum* checks (NI 5439, NIAW 1415) and two *durum* checks (UAS 446, AKDW 2997-16) at three nitrogen levels (40, 60 and 80 kg/ha) in split plot design, replicated thrice. Main plots comprised the nitrogen levels and the genotypes were planted in the sub plots. The trial was conducted at three locations (Dharwad, Pune and Washim). Full nitrogen as per treatment, phosphorus 30 kg (P_2O_5) and potash (20 kg K_2O /ha) were applied as basal dose at the time of sowing. Other management practices and weed control measures were followed as per the recommended package of practices for the zone. The normalized seed rate used was 125 kg/ha (considering the 1000 grains weight of 38 g). Centre wise data on yield and various yield attributes are given in Annexure –I as Table 5.2.1 to 5.2.3.

The pooled analysis of data received from three locations (Table 5.2) revealed significant effect of N level on yield and yield attributes except grains/earhead. On an average basis across genotypes, application of 80 kg N/ha produced maximum and significantly higher grain yield (17.70 q/ha) than 60 (15.54 q/ha) and 40 kg N/ha (13.86 kg/ha) application. The test genotype UAS 375 (*aestivum*) was ranked at 1st position and produced significantly higher grain yield (17.33 q/ha) than the other test genotypes and check varieties but remained statistically at par with check variety NI 5439. The *durum* entries i.e. HI 8777 ranked 7th (14.51 q/ha) and MACS 4028 ranked 6th (15.07 q/ha), where as both checks were yielded more than test entries i.e. UAS 446 (15.61 q/ha) and AKDW 2997-16 (15.12 q/ha). The higher grain yield in UAS 375 was mainly contributed by significantly higher number of grains/earhead (23.98)

compared to other test varieties and check genotypes. The lesser yield in durum entries are might be due to lesser number of earheads per square meter and grains/earhead.

Production Technologies

PRODUCTION TECHNOLOGIES

The results of experiments on updating the package of practices are presented in this section. Various special coordinated trials on evaluation of herbicides for control of broad leaved weeds in wheat, control of lodging and yield maximization, efficient water management using micro-irrigation, evaluation of hydrogel under different irrigation levels, effect of organic manures and mulching effect on wheat productivity, evaluation of performance of line sowing against dibbling and validation of nutrient expert in wheat were conducted to address the various issues in different wheat growing zone.

SPL-1: Evaluation of herbicides for control of broadleaved weeds in wheat

This trial was conducted in five wheat growing zones (NHZ, NWPZ, NEPZ, CZ and PZ) to identify effective herbicides for control of broad leaved weeds in wheat. The trial was conducted in RBD with eleven weed control treatments replicated thrice. The eleven weed control treatments were i) *Halauxifen-methyl ester+Florasulam 40.85% WG+surfactant Polyglycol 26-2 N (12.76 g a.i +750 ml./ha)*; ii) *Metsulfuron methyl 20 WG + surfactant (4.0 g a.i +625 ml./ha)*, iii) *Carfentrazone 40DF (20.0 g a.i./ha)*; iv) *2,4-D Na 80 WP (500 g a.i./ha)*; v) *2,4-D E 38 EC (500 g a.i./ha)*; vi) *Metsulfuron+carfentrazone +surfactant (4.0 g+20 g+625 ml/ha)*; vii) *2,4-D Na + Carfentrazone (400+20 g a.i./ha)*; viii) *2,4-D E + Carfentrazone (400+20 g a.i./ha)*; ix) *Halauxifen methyl + florasulam+ carfentrazone + surfactant (10.21+20 g a.i.+750 ml /ha)*; x) *Weedy check and xi) Weed free*. Broadleaved herbicides were applied at 30-35 days after sowing. A blanket dose of clodinafop 60 g/pinoxaden 50 g/fenoxyaprop 100 g/ha was applied about 5 days before or after the broad leaf herbicide application to control grassy weeds. Observations on weed density and dry weight were recorded at 30, 60 and 90 days after herbicide spray. For irrigation and fertilization, the recommended package of practices for the zone was followed. The zone wise performance of herbicide is given hereunder.

In Northern Hills Zone, trial was conducted at four centres (Almora, Bajaura, Khudwani and Malan). The pooled analysis (Table 6.1) revealed that weed free treatment produced maximum and significantly higher grain yield (48.26 q/ha) as compared to other treatments. The next best treatment was combination of Halauxifen methyl+florasulam+carfentrazone application ranked 2nd place on grain yield (46.97 q/ha). This treatment also reduced weed number and dry weight to great extent as compared to other treatments. Other herbicide combinations like Halauxifen+Florasulam and Metsulfuron+carfentrazone were also quite effective in controlling the weeds and gave similar yield. The earheads/sq. m. and the grain yield of wheat were also recorded significantly higher in these treatments as compared to other herbicide treatments.

The perusal of data presented in Tables 6.1 to 6.2 on broad leaf weed density and dry weight as well as wheat yield and yield attributes revealed that herbicide application caused a significant reduction in weed density and dry weight of weeds and as a result there was

significant improvement in wheat yield. Among herbicides, Halauxifen methyl + florasulam+ carfentrazone+surfactant (10.21+20+750 g a.i./ha) (T9) was found the best treatment in controlling broad leaf weeds density and dry weight in wheat crop on pooled basis followed by Metsulfuron+carfentrazone (4.0+20 g a.i./ha) and Halauxifen-methyl Ester+florasulam 40.85% WG (12.76 +750 g a.i./ha).

In North Western Plains Zone, trial was conducted at seven centres (Durgapura, Gurdaspur, Hisar, Jammu, Karnal, Ludhiana and Pantnagar). Perusal of the data presented in Tables 6.3 to 6.6 on broad leaf weed density and dry weight as well as wheat yield and yield attributes revealed significant reduction in weed density and dry weight of weeds as a result of herbicide application. The reduction in weed infestation was reflected in yield improvement. The weed competition during the growing season recorded the lowest wheat yield of 37.3 q/ha and season long weed free conditions resulted in maximum wheat yield of 60.8 q/ha. Among herbicides, Halauxifen methyl + florasulam+ carfentrazone+surfactant (10.21+20 g a.i.+750 ml/ha) was found the best treatment in controlling broad leaf weeds density and broadleaved weeds dry weight on pooled basis was minimum in tank mix combination of 2,4-D E and carfentrazone. At Karnal centre, the tank mix combination of ready mixture halauxifen + florasulam with carfentrazone was the most effective treatment in controlling the diverse weed flora in wheat. Carfentrazone alone was not effective against *Lathyrus aphaca*.

In North Eastern Plains Zone, this experiment was conducted at five locations viz. Coochbehar, Faizabad, Kalyani, Sabour and Varanasi. The pooled analysis of data from five locations (Table 6.7 and 6.8) revealed that weed free treatment produced maximum and significantly higher grain yield (51.20 q/ha) as compared to other treatments. The next best treatment was combination of Halauxifen methyl + florasulam + carfentrazone + Surfactant application ranked at 2nd place on grain yield (47.68 q/ha). This treatment also reduced weed number and dry weight to great extent as compared to other treatments. Other herbicide combinations like Halauxifen + Florasulam + Polyglycol and Metsulfuron + carfentrazone + surfactant were also quite effective in controlling the weeds and gave similar yield.

In Central Zone, this trial was conducted at three locations (Bilaspur, Indore and Udaipur). The pooled analysis showed significant effect of herbicide application on grain yield and yield attributes of wheat as well as on weeds (Table 6.9 and 6.10).

The highest yield was obtained under weed free situations (54.95 q/ha). A close comparison among herbicides shows better performance of Metsulfuron + carfentrazone (52.95 q/ha) followed by 2,4-D E + carfentrazone (52.30 q/ha). Gain in yield was due to better weed control as a result significantly higher number of earheads/sq. m. The performance of halaxifen + florasulam in combination with carfentrazone and 2,4-D in combination with carfentrazone was better compared to other herbicide treatments.

*Original values in parenthesis and square root transformed ($\sqrt{X+0.5}$) value used for statistical analysis

In Peninsular Zone, this trial was conducted at only one centre i.e. Dharwad. The analysed data showed significant effect of herbicide application on grain yield and yield attributes (Table 6.11). The highest yield was obtained under weed free situations (44.10 q/ha). A close comparison among herbicides showed better performance of Halauxifen methyl + florasulam+ carfentrazone (42.20 q/ha) followed by Metsulfuron + carfentrazone +surfactant (41.50 q/ha). Gain in yield was due to significantly higher number of earheads/sq.m. and thousand grain weight. At Dharwad the weed pressure was low as compared to other centres but here also the Halauxifen methyl + florasulam+ carfentrazone was the best herbicide treatment in reducing the weed population and dry weight.

SPL-2: Management of lodging and yield maximization in wheat

This experiment was conducted to maximise wheat yield with target yield of 6 and 7 t/ha using crop growth regulators Chlormequat chloride (Lihocin) and tebuconazole (Folicur 430 SC). Experiment consists of four fertiliser treatments viz. control, RDF, 150 % RDF and 150 % RDF +15 t FYM/ha in main plots and four growth regulators viz control, two sprays of 0.2% Chlormequat chloride (CCC), two sprays of tebuconazole (0.1%) and two sprays of combination of CCC and tebuconazole in split plot design and replicated thrice. Growth regulators were used twice i.e. at first node and flag leaf stages. The sowing was done using the normalized seed rate of 100 kg/ha (adjusted considering 1000 grains weight as 38 g). Irrigation and weed control measures were followed as per recommended package of practices for the concerned zone. This trial was conducted in five zones and zone wise results are given here under

In Northern Hills Zone, this experiment was conducted at Almora (UttaraKhand), Bajaura (Kullu, HP), Khudwani (Anantnag, J&K) and Malan (Palampur, HP). The pooled analysis showed that increasing fertiliser doses enhanced grain yield significantly (Table 6.12). Application of 150% RDF has increased the grain yield (50.45 q/ha) to the tune of 10.0% over RDF (45.40 q/ha). Even 15 t/ha FYM application along with 150% RDF increased the grain yield (51.06 q/ha) numerically as compared to 150% RDF application. Two spray of tebuconazole produced maximum grain yield (45.30 q/ha) which was significantly higher than other treatments. Application of CCC @ 0.2 % + tebuconazole @ 0.1 % twice in crop season reduced the plant height significantly as compared to other treatments.

In NWPZ this trial was conducted at seven centres namely at Agra, Durgapura, Hisar, Jammu, Karnal, Ludhiana and Pantnagar. The data from Pantnagar was excluded from pooled analysis because of different trend. The pooled analysis showed significant effect of fertilizer application on grain yield and yield attributes (Table 6.13).

Centres: Agra, Durgapura, Hisar, Jammu, Karnal, Ludhiana

*Mean of six centres (Agra, Hisar, Jammu, Karnal, Ludhiana, Pantnagar)

The grain yield enhanced significantly with increasing fertiliser doses. The application of 150 % RDF increased the grain yield (56.44 q/ha) to the tune of 2.7 % over RDF (54.95 q/ha). Also, the addition of 15 t/ha FYM application along with 150 % RDF increased the grain yield (58.17 q/ha) significantly as compared to 150 % RDF application. Two spray of Chlormequat chloride (Lihocin) 0.2 % + tebuconazole (Folicur 430 SC) 0.1% produced maximum grain yield (51.25 q/ha) which was significantly higher than other treatments. This showed that growth retardant in combination with fungicide tebuconazole is more effective rather alone application. CCC @ 0.2 % + tebuconazole @ 0.1 % twice in crop season application produced maximum yield attributing parameters but reduced the plant height significantly as compared to other treatments. There was drastic reduction in lodging when CCC was applied alone or in combination with fungicide. The reduction was more prominent, where combination of Lihocin and Folicur was applied. The reduction in lodging was due to reduction in plant height. Lodging score was reported by all the centres except Durgapura. The results showed that increasing the fertiliser rates in combination with growth retardant application increased the grain yield. Centre wise data are presented in Table 6.13.1 to 6.13.7.

In NEPZ, this experiment was conducted at ten centres namely Burdwan, Coochbehar, Faizabad, Kalyani, Kanpur, Ranchi, RAU Pusa, Sabour, Shillongani and Varanasi. The pooled analysis showed that increasing fertiliser doses enhanced grain yield significantly (Table 6.14). The application of 150 % RDF has increased the grain yield (49.39 q/ha) to the tune of 14.5 % over RDF (43.13 q/ha). Even 15 t/ha FYM application along with 150 % RDF increased the grain yield (50.66 q/ha) significantly as compared to 150 % RDF application. Two spray of CCC+tebuconazole produced maximum grain yield (41.82 q/ha) which was significantly higher than other treatments. This showed that growth retardant in combination with fungicide is more effective rather alone application. CCC @ 0.2 % +tebuconazole @ 0.1 % twice in crop season application produced maximum yield attributing parameters and biomass and simultaneously reduced the plant height significantly as compared to other treatments. It is interesting to note that growth retardant application reduced the plant height and at the same time increased the biomass indicate more vigour stem production which ultimately reduces the chances of lodging. Lodging score was mainly reported from Burdwan center and in few treatments at Coochbehar and Sabour. This confirms that increasing the fertiliser dose in combination with growth retardant application increases the grain yield.

In Central Zone, this trial was conducted at eight locations (Bilaspur, Gwalior, Indore, Jabalpur, Junagadh, Kota Udaipur and Vijapur). A perusal of pooled data analysis of the eight centres presented in Table 6.15 showed that the highest yield was recorded under the treatment 150%RDF+FYM (53.07 q/ha) as compared to all other treatments. The treatments two sprays of Lihocin and two sprays of Lihocin+Folicur are statistically at par whereas the treatment two sprays of Lihocin+Folicur (47.45 q/ha) is statistically higher than the treatment two sprays of Folicur (46.61 q/ha). The yield increment may be due to more earheads/sq. m.

and higher number of grains per earhead. Application of growth retardants reduced plant height drastically as compared to control. Minimum plant height is observed under two sprays of Lihocin (82.88 cm) followed by two sprays of Lihocin+Folicur (82.99 cm). Lodging was not reported at any centre from the Central zone. The centre wise data are presented in Annexure I as Tables 6.15.1- 6.15.8.

Centres: Bilaspur, Gwalior, Indore, Jabalpur, Junagadh, Kota, Udaipur, Vijapur

In Peninsular Zone this trial was conducted at Dharwad, Niphad, Pune and Ugar Khurd. The pooled data of four centres revealed that among main plot treatments 150% RDF + 15 t/ha FYM produced maximum yield (46.94 q/ha) followed by 150 % RDF (45.53 q/ha) and both the treatments remained statistically at par (Table 6.16). Among growth retardant treatments two sprays as tank mix -Lihocin@ 0.2% + Folicur 430 SC @0.1% produced maximum yield (42.71 q/ha) followed by two sprays of Folicur 430 SC@0.1% (41.31 q/ha) and remained statistically at par.

However, tank mix application of both growth retardants produced significantly higher yield than Lihocin @ 0.2% alone (40.67 q/ha) and control (39.35 q/ha). The gain in yield might be contributed by higher thousand grain weight and more number of earheads per square meter. The significantly least plant height was recorded in treatment Lihocin @ 0.2% (76.88 cm) followed by tank mix –Lihocin @ 0.2% + Folicur 430 SC @ 0.1% (78.62 cm), two sprays of Folicur 430 SC @ 0.1% (81.65 cm) and control (82.19 cm). Contrary to the plant height, maximum and significantly higher biomass was recorded in treatment tank mix –Lihocin @ 0.2% + Folicur 430 SC @ 0.1% (104.97 q/ha) followed by Folicur 430 SC@0.1% (101.4 q/ha). There is no significant difference was observed in control (97.26 q/ha) and Lihocin @ 0.2% (96.42 q/ha) as far as biomass production is the concern. Lodging was not reported from any centre.

SPL-3: Efficient nutrient management in maize/soybean-wheat system

To study the precision nutrient management for maize-wheat cropping system in Peninsular Zone a special coordinated trial SPL-3 was conducted at Dharwad and Niphad centre. The experiment was conducted in randomized block design with ten treatment combinations (Wheat RDF, 125% of RDF, RDF for 4.0 t ha⁻¹ targeted yield, RDF for 5.0 t ha⁻¹ targeted yield, RDF for 6.0 t ha⁻¹ targeted yield, RDF for targeted yield - 4t ha⁻¹, RDF for targeted yield-5t ha⁻¹, RDF for targeted yield - 6t ha⁻¹, Absolute control-Wheat, and Absolute control-Wheat) and each treatment was replicated thrice. In Kharif season Maize-soybean crops were planted in the field with 10 treatments (T1: Maize RDF, T2: 125% of RDF, T3: RDF for 6.0 t ha⁻¹ targeted yield, T4: RDF for 6.0 t ha⁻¹ targeted yield, T5: RDF for 6.0 t ha⁻¹ targeted yield, T6: RDF Soybean, T7: RDF Soybean, T8: RDF Soybean, T9: Absolute control-Soybean, T10: Absolute control-Maize) and replicated thrice.

The data presented in Table 6.17 illustrated that highest wheat yield (46.10 q/ha) was produced by RDF for targeted yield of 6 t/ha followed by 45.52 q/ha), T2 (44.27 q/ha), T7 (43.73 q/ha) and T4 (43.20 q/ha) and remained statistically at par. The highest yielder treatment (RDF for targeted yield – 6 t/ha) was significantly higher than recommended dose of wheat fertilizers which produced 41.98 q/ha. The gain in yield was contributed by grains per earhead, thousand grain weight and number of earheads per square meter. Centre wise wheat yield attributes are presented in Annexure-I as Table 6.17.1 and 6.17.2. For maize T5 (RDF for 6.0 t ha⁻¹ targeted yield) produced significantly higher grain yield (70.77 q/ha) than all other treatments. The increment in yield might be contributed by thousand grain weight (381 g). In case of soybean except control (17.34 q/ha) all other treatments produced similar grain yield (22.42 q/ha, 23.55 q/ha, 17.34 q/ha respectively).

Equivalent wheat yield for the Maize-Wheat and Soybean-Wheat systems were calculated and it was found that maximum wheat equivalent yield was obtained under 125% of recommended dose of fertilizers (131.63 q/ha) followed by RDF for 6.0 tha⁻¹ targeted maize yield (127.83 q/ha) which were at par. Almost similar trend was observed at both the centres.

SPL-4: Validation of leaf colour chart (LCC) for different wheat varieties

An experiment was conducted to validate the leaf colour chart for different varieties for higher nitrogen use efficiency. The experiment was conducted in split plot design with three varieties in main plots and seven N management treatments in sub plots and each treatment was replicated thrice. Seven nitrogen management levels were (1) no nitrogen, (2) 150 kg N/ha, (3) N management by LCC- 1/3rd N as basal, 1/3rd N at first irrigation and the remaining based on LCC as application of 35 kg N/ha if LCC<4 and 25 kg N/ha if LCC ≥4, (4) N management by LCC-1/3 N as basal, 1/3rd N at first irrigation and the remaining based

on LCC as application of 45 kg N/ha if LCC<4 and 35 kg/ha if LCC \geq 4, (5) N management by LCC-1/3rd N as basal, 1/3rd N at first irrigation and the remaining based on LCC as application of 55 kg N/ha if LCC<4 and 45 kg N/ha if LCC \geq 4, (6) N management through green seeker, (7) N-Rich plot 225 kg/ha. The varieties used were HPW 349, VL 907 and HS 507 in NHZ and WH 1105, HD 2967 and DPW 621-50 in NWPZ. The sowing was done using the normalized seed rate of 100 kg/ha (adjusted considering 1000 grains weight as 38 g). Nitrogen was applied as per the treatments and 60 kg P₂O₅/ha and 40 kg K₂O/ha were applied as basal in all the treatments. Irrigation and weed control measures were followed as per recommended package of practices for the concerned zone.

In NHZ, this trial was conducted at Almora (UttaraKhand), Bajaura (Kullu, HP), Khudwani (Anantnag, J&K) and Malan (Palampur, HP). Perusal of data presented in Table 6.18 revealed that application of nitrogen at 145 kg/ha in LCC based N application treatment number T5 recorded the highest yield (45.78 q/ha) which was significantly higher than all other treatments except N rich (225 kg N/ha) treatment (45.19 q/ha). In addition, the nitrogen saving in this treatment was about 3.3%. The highest biomass (121.78 q/ha) was recorded in N rich treatment which at par with treatment number 5 but significantly higher than rest of the treatments. Earhead density also showed the similar trend.

In North Western Plains Zone, the trial was conducted at six centres (Agra, Durgapura, Hisar, Jammu, Ludhiana and Pantnagar). The data of two centres where Green seeker treatment was not implemented were pooled separately. A perusal of pooled analysis of data showed that the N management had significant effect on wheat productivity as well as yield attributing characters. The significantly highest mean yield of 60.92 q/ha was recorded in N rich plots, where N was applied at 225 kg/ha and was followed by recommended N application treatment (150 kg/ha). In comparison to recommended blanket N application *i.e.* as 1/3rd N (50 kg/ha) as basal, 1/3rd N at first irrigation and 1/3rd N at second irrigation, N scheduling using LCC as 1/3rd N (50 kg/ha) as basal, 1/3rd N at first irrigation and the remaining LCC based – applied @ 55 kg N/ha if LCC<4 and 45 kg N/ha if LCC \geq 4 produced similar yield and rest of the treatments were inferior. The nitrogen management by LCC (Apply 55 kg N/ha if LCC<4 and 45 kg N/ha if LCC \geq 4) was significantly superior than N management by other LCC treatments (35 kg N/ha if LCC<4 and 25 kg N/ha if LCC \geq 4 as well as 45 kg N/ha if LCC<4 and 35 kg N/ha). In addition, this treatment saved about 3.3% nitrogen compared to recommended practice with similar grain yield. Gain in yield was recorded due to higher earheads/sq. m. Among genotypes WH 1105 produced higher yield compared to DPW 621-50 and HD 2987. The highest grain yield (63.77 q/ha) was obtained with WH 1105 when N was applied at 225 kg/ha. Under no fertilizer application, mean wheat yield obtained was 33.63 q/ha.

SPL-5: Efficient water management in wheat using micro-irrigation

Water management is the key issue for economising the irrigation water use efficiency of wheat crop. To optimize the water requirement for yield maximisation in wheat, a special coordinated trial was planned and conducted under irrigated timely sown conditions at three locations *i.e.* Durgapura and Karnal in NWPZ, Vijapur in CZ. The experiment was conducted in randomized block design with four replications. The sowing was done using a normalized seed rate of 100 kg/ha (adjusted considering 1000 grains weight as 38 g). Fertiliser and weed control measures were followed as per recommended package of practices for the zone.

In North Western Plains Zone, the treatments comprised of seven irrigation treatments involving three irrigation systems namely conventional flood irrigation; drip irrigation and sprinkler irrigation. In flood method of irrigation water was applied at critical stages (CRI, T, JT, BL, M and D). The pooled analysis of two centres is presented in Table 6.21. Irrigation effects were significant on yield and yield attributes. The highest yield (57.10 q/ha) was recorded in drip irrigation with 100% PE, which was significantly higher than other irrigation treatments except six irrigations at critical growth stages. The better yield was mainly due to better effective earhead per metre square and bolder grains. Maximum water use was in sprinkler with 100% PE (430.5 mm) followed by check basin irrigation system (396.3 mm).

Table 6.21. North Western Plains Zone		SPL-5		Pooled	2016-17
Irrigation treatments	Earheads/ sq. m.	1000 Grains Weight, g	Grains/ Earhead	Yield, q/ha	Water use, mm

CD (0.05)	31.6	1.58	2.18	3.14	

Centres: Durgapura, Karnal

In Central Zone, seven irrigation treatments followed were 60 mm check basin irrigation at critical growth stages (CRI, T, JT, BL, M and D), drip irrigation with 60%, 80% and 100% PE at 3 days interval, drip irrigation at 0.8, 1.0 and 1.2 IW/CPE i.e. 50 mm irrigation when cumulative Pan Evaporation (CPE) reaches 60 mm, 50 mm and 40 mm, respectively. Sowing was done using seed rate @ 100kg/ha (adjusted considering 1000 grains weight as 38 g). Fertilizer was applied as per recommendation (1/3rd N, full P & K as basal and the remaining 2/3rd nitrogen as 1/3rd at CRI and next 1/3rd at Jointing).

Table 6.22. Central Zone		SPL-5		Vijapur	2016-17
Irrigation treatments	Earheads/ sq. m.	1000 Grains Weight, g	Grains/ Earhead	Yield, q/ha	Water use, mm
60 mm check basin	400	47.83	16.31	31.11	420.00
60% PE	433	52.48	16.75	37.72	212.58
80% PE	470	51.00	18.63	44.55	263.44
100% PE	505	45.38	19.63	44.81	314.30
0.8 IW/CPE	405	52.50	13.75	29.33	260.00
1.0 IW/CPE	458	53.48	17.38	42.34	310.00
1.2 IW/CPE	491	50.30	18.47	45.44	360.00
CD (0.05)	40.89	4.45	3.53	6.60	

The results presented in Table 6.22 revealed highest yield under drip irrigation at 1.2 IW/CPE (45.44 q/ha) followed by drip irrigation with 100% PE (44.81 q/ha) as compared to other irrigation treatments. The highest yield in drip irrigation at 1.2 IW/CPE may be

attributed to more earheads/sq. m. and higher number of grains per earhead. The treatment drip irrigation with 0.8 IW/CPE recorded lowest yield with respect to other irrigation treatments (29.33 q/ha). Maximum water use was in 60mm check basin irrigation treatment (420 mm).

SPL-6: Evaluation of Pusa Hydrogel and herbal Hydrogel on in situ moisture conservation under different irrigation levels in wheat

To improve the water use efficiency and wheat productivity a special coordinated trial SPL-6 was conducted in split plot design with three replications in North Western Plains Zone and Central Zone. The main plots comprised of four irrigation treatments (no irrigation, three irrigations (CRI, LT and GF), six irrigations (CRI, T, JT, BL, F, M) and three irrigations (at 35/40 DAS, 80 DAS and 120 DAS) while the hydrogel treatments (control, Pusa Hydrogel and herbal Hydrogel) were included in sub plots. Fertilizer was applied as per recommendation (1/2 N, full P & K as basal and the remaining 1/2 nitrogen at first irrigation in except in no irrigation treatment where full NPK was applied as basal).

Centres: Durgapura, Karnal, Ludhiana, Pantnagar.					

This trial was conducted at four locations in NWPZ i.e. Durgapura, Karnal, Ludhiana, Pantnagar. The pooled analysis data are presented in Table 6.23. The effect of irrigation and hydrogel was found significant on wheat productivity but their interactions were non significant. On mean basis, significantly highest yield (59.52 q/ha) was recorded where six irrigations were applied at critical growth stages of wheat. The better yield was due to better yield attributes in this treatment. The lowest mean yield of 31.82 q/ha was obtained where no irrigation was given. There was significant yield improvement with application of hydrogel either Pusa or herbal. The differences between two hydrogel (Pusa and Herbal) were non significant. The data of individual centres are given in the Annexure-I in Table 6.23.1 and 6.23.2.

In Central Zone, this trial was conducted at Junagarh centre only. The data presented in Table 6.24 illustrated that there is no significant difference between hydrogel treatments. The highest yield has been observed under six irrigation treatment (30.24 q/ha) and is statistically higher as compared to other treatments. The yield increment may be attributed to more earheads/sq. m. and higher number of grains per earhead.

In Peninsular Zone, the trial was conducted only at Pune centre. The data presented in Table 6.25 illustrated there is no significant difference between hydrogel treatments and control, all treatments produced statistically similar yield. Numerically maximum yield was recorded in treatment herbal hydrogel (37.90 q/ha) followed by Pusa hydrogel (36.76 q/ha) and control (35.57 q/ha). Among irrigation treatments maximum and significantly higher yield was recorded in treatment three irrigations at CRI, late tillering and grain filling stages (52.07 q/ha) followed by in six irrigations at critical growth stages (50.83 q/ha) and remained at par. The gain in yield was contributed by higher number of earhead/sq. m., grains/earhead and higher thousand grain weights.

SPL-7: Wheat yield maximization under different tillage options

To identify the effective varieties for Conservation Agriculture system an experiment was conducted at four locations (Hisar, Karnal, Ludhiana and Pantnagar) in NWPZ. The experiment was conducted in split plot design with two tillage options (Conventional tillage and Conservation Agriculture) in main plots and six timely sown varieties (WH 1105, HD 2967, DPW 621-50, DBW 88, HD 3086 and PBW 550) in sub plots and each treatment was replicated thrice. The conservation agriculture treatment consisted of zero tillage with

residue retention. This experiment was under rice-wheat system except Hisar centre where cotton-wheat system was adopted. Recommended dose of fertilizers 150 kg N/ha, 60 kg P₂O₅/ha, and 40 kg K₂O/ha was applied as 1/3rd N and full dose of P₂O₅, and K₂O as basal dose. The remaining nitrogen was applied in two equal splits at just before first and second irrigations. The sowing was done using the normalized seed rate @ 100 kg/ha (adjusted considering 1000 grains weight as 38 g). Irrigation measures were followed as per recommended package of practices for the zone.

The pooled analysis data of four centres are presented in Table 6.26. The effect of tillage options and varieties as well as their interactions were non-significant. Except grains/earhead differences among varieties. On mean basis among varieties, the highest yield was recorded with cultivar HD 2967 (57.18 q/ha) and between two tillage options, conservation agriculture treatment recorded better yield (56.45 q/ha) than the conventional tillage treatment (55.76 q/ha). The highest yield (57.46 q/ha) was recorded in conservation agriculture treatment with HD 2967 cultivar and this variety was also top yielder under CT system. The second best cultivar under both systems was HD 3086, which also yielded higher in CA compared to CT system. The non-significant interaction effects mean that varieties good under CT are also good under CA system. The centre wise data have been given as Table 6.26.1 to 6.26.4 in Annexure I.

SPL-8: Control of pre-harvest sprouting (PHS) in wheat

To control pre harvest sprouting in wheat, three chemicals (NaCl, paraquat and Na molybdate) at different doses were tried in two varieties (CBW 38 and K 0307) at Coochbehar and Shillongani. Shillongani centre data was rejected due to unable to record yield data. The experiment was conducted in split plot design with varieties in main plots and chemicals (NaCl-5, and 7.5% Paraquat 120 and 240 g and Na molybdate-150 and 200 ppm) in sub-plots with three replications. The sowing was done using the normalized seed rate @ 100 kg/ha (adjusted considering 1000 grains weight as 38 g). Fertilization and irrigation measures were followed as per recommended package of practices for the zone. Spraying NaCl and Na-molybdate was done at milk and maturity stage whereas paraquat at maturity stage only. Data analysis showed that there was no significant difference in grain yield and yield attributes between two varieties as well as different treatments application (Table 6.27). Though CBW 38 (37.62 q/ha) produced higher grain yield than K 0307 (34.87 q/ha). Paraquat @ 240 g/ha application at maturity stage recorded maximum grain yield (37.38 q/ha) and remain at par with control (Table 6.27).

SPL-9: Effect of mulch with irrigation

In this experiment both mulch (4 t/ha) and without mulch treatments at 0, 1 and 3 irrigations were tried in three tillage options (ZT, Bed, CT) in split plot design with three replications at Coochbehar and Shillongani. Tillage options were in main plot and mulch treatments were in subplot. The sowing was done using the normalized seed rate @ 100 kg/ha (adjusted considering 1000 grains weight as 38 g). Fertilization measures were followed as per

recommended package of practices for the zone. Pooled analysis data presented in Table 6.28 showed that bed planting (34.72 q/ha) and conventional tillage (34.25q/ha) produced at par grain yield but significantly higher than zero tillage (29.67 q/ha). Rice straw mulch application at 0, 1, and 3 irrigations recorded significantly higher grain yield than their respective counterpart without mulch application. Maximum grain yield (42.75 q/ha), earhead/m² (317), grains/earhead (36.00) and thousand grains weight (39.10) were obtained with straw mulch at 3 irrigation application which were significantly higher than other treatments.

SPL-10: Mulching to mitigate the effect of climate change

An experiment was conducted with the aim to mitigate the terminal heat effect using straw and organic manure mulch as well as the chemical spray ($ZnSO_4$ and KCl). This experiment was conducted in split plot design at four centres (Hisar, Karnal, Ludhiana and Pantnagar) in NWPZ, three centres (Kalyani, Ranchi and Varanasi) in NEPZ and one centre *i.e.* Udaipur in CZ. The two sowing time (timely and late) were in the main plot and sub plot treatments consisted of six fertiliser applications. The six fertilizer application treatments were recommended fertilizer dose (RDF), RDF+10 t/ha FYM, RDF+ 4t/ha rice straw mulch, RDF+ 10 t/ha FYM+4t/ha rice straw mulch, T4+ 0.5 % $ZnSO_4$ and T4+ 0.2% KCl (Two spray). The conventional sowing was done using the normalized seed rate of 100 kg/ha (adjusted considering 1000 grains weight as 38 g) and the fertilisation practices were followed as per treatment. The weed control and irrigation measures were followed as per recommended package of practices for the respective zone.

In NWPZ, the pooled analysis (Table 6.29) showed that timely sowing (62.29 q/ha) produced significantly higher grain yield than late sowing (46.93 q/ha). Delaying wheat sowing reduced the grain yield by 24.7 %. The reduction in yield was due to reduction in earhead density and grain weight. Application of 0.2 % KCl produced numerically higher grain yield (55.47 q/ha) than all other treatments. Application of FYM (10 t/ha) along with recommended fertiliser recorded higher grain yield (55.21 q/ha) than RDF alone (53.09 q/ha). Individual centre data are given in Table 6.29.1 and 6.29.2 in Annexure-I.

In NEPZ, this experiment was conducted with recommended fertiliser doses alone and in combination with FYM (10 t/ha), 4t/ha straw mulch and combination of all these along with $ZnSO_4$ (0.5 %) and KCl (0.2 %) application separately under timely and late sown condition. This experiment was conducted in split plot design at Kalyani, Ranchi and Varanasi. Main plot treatments were sowing time and sub plot treatments were six fertiliser applications. The conventional sowing was done using the normalized seed rate @ 100 kg/ha (adjusted considering 1000 grains weight as 38 g) and other as per treatment. Fertilization and irrigation measures were followed as per recommended package of practices for the zone.

Pooled analysis showed that timely sowing (44.50 q/ha) produced significantly higher grain yield (Table 6.30) than late sowing (34.84 q/ha). Delaying wheat sowing reduced the grain yield by 21.7 %. Maximum grain yield was obtained at recommended dose of fertiliser along with FYM and mulch application (40.68 q/ha) followed by this treatment in combination with KCl (40.60 q/ha) and $ZnSO_4$ (40.43 q/ha) application. Yield attributing parameters were significantly influenced by sowing time.

Centres: Kalyani, Ranchi, Varanasi

In Central Zone, this experiment was conducted at Udaipur centre only. The data presented in Table 6.31 showed that timely sowing yielded significantly higher (53.47 q/ha) as compared to late sowing (44.80 q/ha). Delay in wheat sowing reduced the grain yield by 16.2%. Application of 0.2% KCl produced significantly higher yield (51.43 q/ha) with respect to all other fertilizer treatments except at par with 0.5% ZnSO₄ application (51.0 q/ha). The increase in yield may be because of more earheads/ sq. m. and higher 1000 grains weight in case of RDF+ 10t/ha FYM+ 4t/ha rice straw mulch+ 0.2% KCl spray. As far as mulches are considered; application of both organic manures and rice straw mulch in addition to recommended fertilizer dose (RDF + 10t/ha FYM + 4t/ha rice straw mulch) yielded significantly higher grain yield (50.58 q/ha) than all other treatments except at par with chemical sprays.

SPL-11: Comparative performance of line versus dibbling in wheat

This trial was conducted in split plot design to evaluate the effect of planting options and spacing on wheat productivity at eight locations in Central Zone (Bilaspur, Gwalior, Indore, Jabalpur, Junagarh, Kota, Powarkheda and Udaipur). The main plots comprised spacing and dibbling whereas sub plot included genotypes (HI 1544, HI 8737). NPK was applied in the ratio of 120:60:40 (1/3rd N, full P & K as basal and the remaining 2/3rd nitrogen as 1/3rd at first irrigation and next 1/3rd at second irrigation.

A perusal of pooled data analysis of the eight centres presented in Table 6.32 revealed that there was significant difference in grain yield and yield attributes between the two varieties. The highest yield was obtained in dibbling 15x15 cm (50.13 q/ha) followed by line sowing @ 20 cm with seed rate of 100 kg/ha (49.54 q/ha) but the differences were not significant. The increment in yield may be attributed to higher number of earheads/sq. m. The other planting options recorded significantly lower yield as compared to these two methods. Though HI 8737 yielded significantly higher (47.91q/ha) as compared to HI 1544 (46.43 q/ha); higher number of earheads/sq.m., more grains/earhead and were recorded in genotype HI 1544. HI 8737 recorded higher 1000 grain weight (49.11g) as compared to HI 1544 (42.78g). The centre wise data are presented in Annexure I as Tables 6.32.1- 6.32.8.

Centres: Bilaspur, Gwalior, Indore, Jabalpur, Junagarh, Kota, Powarkheda, Udaipur.

In Peninsular Zone this trial was conducted at three locations (Akola, Dharwad and Niphad). The main plots comprised spacing and dibbling whereas sub plot included genotypes (UAS 304, NIAW 301). NPK was applied in the ratio of 120:60:40 (1/3rd N, full P & K as basal and the remaining 2/3rd nitrogen as 1/3rd at first irrigation and next 1/3rd at second irrigation. A perusal of pooled data analysis of the three centres presented in Table 6.33 revealed that there was no significant difference in grain yield and yield attributes. The highest yield was obtained in line sowing @ 20 cm with seed rate of 100 kg/ha (46.63 q/ha) followed by dibbling @15x15 cm (43.18 q/ha) and remained at par. The increment in yield may be

attributed to higher number of earheads/sq. m. The other planting options recorded significantly lower yield as compared to these two methods. UAS 304 yielded higher (40.30 q/ha) as compared to NIAW 301 (38.77 q/ha) with all higher yield attributing characters. The centre wise data are presented in Annexure-I as Tables 6.33.1- 6.33.3.

SPL-12: Precision nutrient management and validation of Nutrient expert in wheat

This experiment was conducted with seven fertiliser doses combination viz. control, Recommended Dose of Fertilizers (RDF), 150 % RDF, 150 % PK, 150 % NK, 150 % NP and nutrient expert in RBD at three locations (Almora, Bajaura and Malan) in NHZ, four location at NWPZ (Hisar, Karnal, Ludhiana, Pantnagar), one location each in NEPZ (Varanasi), CZ (Udiapur and PZ (Dharwad). The conventional sowing was done using the normalized seed rate @ 100 kg/ha (adjusted considering 1000 grains weight as 38 g). Weed control and irrigation measures were followed as per recommended package of practices for the zone.

The data presented in Table 6.34 showed that 150% RDF gave maximum and significantly higher grain yield (49.59 q/ha) and biomass (118.69 q/ha) as compared to other treatments. This was followed by nutrient expert treatment which was at par with 150% RDF and produced almost 6.45% higher grain yield than recommended dose of fertiliser (RDF) application. Omission of phosphorus and potash had marginal effect on productivity but the omission of nitrogen drastically reduced the productivity. Therefore, it could be said that the major response was to the nitrogen application alone and the response was significant even up to 150% N application. This indicates that the nutrient recommendation for the northern

hills needs a relook for achieving higher productivity. The targeted yield level of 6 t/ha could not be achieved and the yield level in nutrient expert was only 4.6 t/ha.

Treatments	Earhead/ sq. m.	Grain/ Earhead	1000 Grains Weight, g	Biomass s, q/ha	Nitrogen, kg/ha	Phosphorus, kg/ha	Potash, kg/ha	Yield, q/ha

Nutrient Expert	378	28.33	43.68	113.05	150	55	72	46.15
CD (0.05)	24.52	1.61	1.75	7.38				3.46

Centres: Almora, Bajaura, Malan

For NWPZ, the pooled analysis data are presented in Table 6.35. The data revealed that 150 % RDF recorded maximum and the highest grain yield (61.45 q/ha) and was at par with recommended fertilizer and nutrient expert treatments. The 150% RDF application produced almost 3% higher grain yield than recommended dose of fertiliser (RDF) application. The lowest yield was recorded in control plots and over control, the 150% PK application produced yield increase of 5.56 q/ha only. Therefore, it could be said that major response was due to N application only. The centre wise performance is given in Tables 6.35.1. to 6.35.3 in annexure I. The targeted yield of 7 t/ha using nutrient expert could not be achieved even after applying more than recommended NPK and the yield level was almost similar.

Treatments	Earheads/ sq. m.	1000 Grains Weight, g	Grains/ Earhead	Biomass, q/ha	Nitrogen, kg/ha	Phosphorus, kg/ha	Potash, kg/ha	Yield, q/ha
Control	238	39.06	33.09	94.72	0	0	0	28.11
Rec. NPK	413	40.32	36.49	155.08	150	60	40	59.73
150 % RDF	463	40.29	33.21	161.24	225	90	60	61.45
150 % PK	283	39.01	31.41	104.21	0	90	60	33.67
150 % NK	435	39.16	34.41	154.86	225	0	60	57.82
150 % NP	441	38.52	33.71	156.13	225	90	0	56.19
Nutrient Expert	433	39.58	34.87	158.24	170	69	83	59.09
CD (0.05)	22.44	1.51	3.37	7.58				2.45

Centres: Hisar, Karnal, Ludhiana, Pantnagar

In NEPZ, this experiment was conducted at Varanasi centre only. The data revealed that 150 % RDF recorded maximum and significantly higher grain yield (59.34 q/ha) and earhead/sq. m. (368) as compared to other treatments (Table 6.36). This was followed by 150 % NP and NK applications. 150% RDF application produced almost 10.8 % higher grain yield than recommended dose of fertiliser (RDF) application. Interestingly, 150 % PK application produced almost similar yield as of control. Therefore, it could be said that response was due to N application only. Nutrient expert based application for targeted yield of 6 t/ha produced significantly lower grain yield (48.42 q/ha) than RDF which seems mainly due to lower nitrogen calculation using nutrient expert.

Table 6.36. North Eastern Plains Zone

CD (0.05)	66	9.69	3.16				2.11

In Central Zone, the highest yield was obtained under Nutrient Expert treatment reaching 55.08 q/ha (Table 6.37) followed by 150% RDF (53.38 q/ha). However, the targeted yield of 6 t/ha could not be achieved. All the yield attributing factors also followed the same trend. The Nutrient Expert treatment also recorded highest biomass (130.22 q/ha).

CD (0.05)	28.15	2.87	5.18	14.10				9.31

At Dharwad centre of Peninsular Zone, the highest yield was obtained under Nutrient Expert treatment with a yield level of 45.15 q/ha (Table 6.38) followed by 150% of RDF (42.32 q/ha) and RDF (40.32 q/ha). The yield by nutrient expert was not significantly higher than recommended dose of fertilizers (40.32 q/ha). Earhead per square meter and thousand grain weight contributed to enhanced yield. In the absence of nitrogen, the least number of earheads/sq. m. were produced whereas in the absence of phosphorus lesser thousand grain weight was recorded. The yield obtained in nutrient expert treatment was the highest but was much below the targeted yield of 6 t/ha.

SOWING DATES FOR DIFFERENT ZONES UNDER IRRIGATED CONDITIONS

ZONE	<i>Triticum aestivum</i>	<i>Triticum durum</i>
NORTHERN HILLS ZONE		
Normal	5 th Nov. to 11 th Nov.	
Late	26 th Nov. to 2 nd Dec.	
Very Late	17 th Dec. to 23 rd Dec.	
NORTH WESTERN PLAINS ZONE		
Normal	5 th Nov. to 11 th Nov.	29 th Oct. to 4 th Nov.
Late	10 th Dec. to 16 th Dec.	26 th Nov. to 2 nd Dec.
Very Late	1 st Jan. to 7 th Jan.	
NORTH EASTERN PLAINS ZONE		
Normal	12 th Nov. to 18 th Nov.	
Late	10 th Dec. to 16 th Dec.	
Very Late	1 st Jan. to 7 th Jan.	
CENTRAL ZONE		
Normal	12 th Nov. to 18 th Nov.	5 th Nov. to 11 th Nov.
Late	3 rd Dec. to 9 th Dec.	
Very Late	24 th Dec. to 31 st Dec.	
PENINSULAR ZONE		
Normal	5 th Nov. to 11 th Nov.	5 th Nov. to 11 th Nov.
Late	26 th Nov. to 2 nd Dec.	
Very Late	17 th Dec. to 23 rd Dec.	
SOUTHERN HILLS ZONE		
Normal	26 th Nov. to 2 nd Dec.	
Late	24 th Dec. to 31 st Dec.	

ANNEXURE-V

LIST OF CENTRES AND COOPERATING SCIENTISTS WORKING UNDER RESOURCE MANAGEMENT PROGRAMME OF THE AICW&BIP (2016-17)

NORTHERN HILLS ZONE

1. Almora Dr Dibakar Mahanta, Scientist (Agronomy),
Division of CPD, VPKAS, Almora, Uttarakhand-263 601.
Email: dibakar_mahanta@yahoo.com, send2dmahanta@gmail.com,
Mobile: 09456108508
2. Bajaura* Dr Gurudev Singh, Assistant Agronomist,
CSK HPKV, HAREC, Bajaura-175 125, Kullu, HP.
Email: gdevsaandil@rediffmail.com, *Mobile:* 09418479856
3. Khudwani Dr Manzur A Ganai, Scientist Agronomy
NRCFC, SKUAST-K, Khudwani, Anantnag- 192 102,
J&K, India.
Email: ganai95@gmail.com, *Mobile:* 09419040596.
4. Malan* Dr Sandeep Manuja, Principal Scientist (Agronomy),
CSKHPKV, RWRC, Malan-176 047, Distt. Kangra, HP.
Email: sandeepmanuja70@gmail.com;
sandeepmanuja70@rediffmail.com
Mobile: 09418112682, 09816900266.
5. Shimla Dr Dharam Pal, Senior Scientist (Plant Breeding),
IARI Regional Station, Tutikandi, Shimla-171 004, HP.
Email: dpwalia@rediffmail.com

NORTH WESTERN PLAINS ZONE

1. Agra Dr BP Singh, Head,
Department of Agronomy, RBS College, Bichpuri,
Agra, UP-283105.
Email: drbpsingh.rbs@gmail.com, *Mobile:* 09412430788
2. Bikaner Dr Ghous Ali, Scientist (Agronomy),
ICAR-CSWRI, Arid Region Campus,
Bichhwal Industrial Area, Bikaner-334006, Rajasthan.
Email: alighous86@gmail.com, *Mobile:* 07023994535
3. Durgapura* Dr PK Sharma, Agronomist (Wheat),
Agricultural Research Station, Durgapura, Jaipur (Rajasthan)
Email: pksharmaskrau@gmail.com, *Mobile:* 09413239604
4. Gurdaspur Dr (Mrs) Charanjit Kaur, Agronomist,
PAU Regional Research Station, Gurdaspur- 143521, Punjab.
Email: virgocharan@yahoo.com, *Mobile:* 09417287920
5. Hisar* Dr Bhagat Singh, Assistant Wheat Agronomist,
Department of Plant Breeding, CCS HAU,
Hisar (Haryana)-125 004.
Email: bsdahiya@gmail.com, *Mobile:* 09813078155
6. Jammu* Dr M C Dwivedi, Assist. Prof. Agronomy,
Division of Agronomy, FOA, SKUAS&T-J,
Chatha, Jammu - 180 009.
Email: drmaheshagron@gmail.com, *Mobile:* 09419203116
7. Karnal Dr RK Sharma, Principal Investigator & PI (RM),
Email: rks20037@gmail.com, *Mobile:* 09416252374
Dr SC Tripathi, Principal Scientist,
Email: subhtripathi@gmail.com, *Mobile:* 09416651464

		Dr Subhash Chander Gill, Principal Scientist, <i>Email: sbhgill@yahoo.com, Mobile:09416361555</i>
		Dr RS Chhokar, Principal Scientist, <i>Email: rs_chhokar@yahoo.co.in, Mobile:09416296262</i>
		Dr Raj Pal Meena, Senior Scientist, <i>Email: adityarajjaipur@gmail.com, Mobile:09466942144</i>
		<i>Dr Kailash Prajapat , Scientist (Agronomy)</i>
		Resource Management, DWR, Karnal-132 001, Haryana
8.	Ludhiana*	Dr Hari Ram Saharan, Senior Wheat Agronomist, Dept. of Plant Breeding, and Genetics, PAU, Ludhiana - 141 004. <i>Email: hr_saharan@yahoo.com, Mobile:09501002967</i>
9.	Nagina	Dr Vivek Yadav, Junior Agronomist, Zonal Research Station, Nagina, Bijnor, UP. <i>Email: vivek_zrsnagina@rediffmail.com,</i> <i>Phone: 01343-250271 (O), 094128 54132</i>
10.	New Delhi	Dr Shiva Dhar, Principal Scientist (Agronomy), Division of Agronomy, IARI, New Delhi - 110 012. <i>Email: drsdmisa@gmail.com, Mobile:09868354933</i>
11.	Pantnagar*	Dr DS Pandey, Prof (Agronomy), <i>Email: drdspandey@gmail.com, , Mobile:09412438860</i> Dr VP Singh, Prof (Agronomy), <i>Email: vps@yahoo.com, Mobile:09451407245</i> Dr Rajeev Kumar, Jr. Research Officer, <i>Email: shuklarajeev@gmail.com, Mobile: 09411320357</i> Department of Agronomy Science, College of Agriculture, GBPUA&T, Pantnagar, US Nagar, Uttarakhand, - 263 145
12.	Sriganganagar	Dr Balram Godara, Wheat Agronomist, Agricultural Research Station, Karni Road, Sriganganagar- 335 001, <i>Email:balram.g.ars@gmail.com, Mobile: 09413155287</i>

NORTH EASTERN PLAINS ZONE

1.	Burdwan	Dr MC Dhara, Chief Agronomist & Ex-officio Joint Director of Agriculture, Field Crop Research Station, Kalna Road, PO & District- Burdwan, West Bengal-713 101. <i>Email: cajdafcrs@gmail.com; madhab.dhara@gmail.com, Mobile: 09433666563</i>
2.	Coochbehar*	Dr Biplob Mitra, Assistant Professor (Sr. Scale), Department of Agronomy, Uttar Banga Krishi Viswavidyalaya, Pundibari, Coochbehar, West Bengal-736165. <i>Email: bipmitra@yahoo.com</i> <i>Mobile: 09434502292</i>
3.	Faizabad*	Dr Rajesh Kumar, Assistant Agronomist (AICW&BIP), Department of Genetics & Plant Breeding, NDUA&T, Kumarganj, Faizabad- 224 229 (UP). <i>Email: rajeshnduat@gmail.com, Mobile: 09415527874</i>
4.	Kalyani*	Dr Dhiman Mukherjee, Associate Prof. (Agronomy), AICWIP, BCKV, Kalyani, District Nadia, West Bengal-741 235. <i>Email: dhiman_mukherjee@yahoo.co.in, Mobile:08902006350</i>
5.	Kanpur*	Dr Rajvir Singh, Asstt Wheat Agronomist, Section of EB (Rabi Cereals), CSAUA&T, Kanpur- 208 002, UP. <i>Email: rajvircsa@rediffmail.com</i>

6. PUSA (RAU) Dr DK Roy, Sr. Scientist (Wheat Agronomist)
Dept. of Agronomy, RAU, Pusa-848 125,
Distt. Samastipur, Bihar.
Email: dr_dhirendra_kroy@yahoo.com,
Mobile: 09430181071
7. Ranchi* Dr. Naiyer Ali, Agronomist (Wheat),
Department of Agronomy, BAU, Kanke,
Ranchi-834 006, Jharkhand.
Email: nali_bau@rediffmail.com, Mobile: 09801241156
8. Sabour* Dr Md Mizanul Haque, Assoc. Prof.-cum-Sr Scientist
(Agronomy), Department of Agronomy, Bihar Agricultural College,
Sabour-813 210, District- Bhagalpur, Bihar
Email: haquemizanul@gmail.com, Mobile: 09431205208
9. Shillongani* Dr TP Saikia, Principal Scientist (Agronomy),
Regional Agricultural Research Station, Assam Agricultural University,
Shillongani, Nagaon-782 002, Assam.
Email: tpsaikia@gmail.com,
Mobile: 09435162356
10. Varanasi* Dr RK Singh, Agronomist (AICW&BIP),
Department of Agronomy, Institute of Agricultural Sciences,
Banaras Hindu University, Varanasi- 221 005 (UP).
Email: rks1660bhu@gmail.com, Mobile: 09450533438

CENTRAL ZONE

1. Bilaspur* Dr Dinesh Pandey, Scientist (Agron),
TCB College of Agriculture & Research Station, IGKV, Sarkanda,
Bilaspur, Chhattisgarh, MP-495 001.
Phone: 07752-254379-80. Email: pdp1974@rediffmail.com, Mobile: 09098546806
2. Gwalior* Dr SPS Tomar, Senior Scientist (Agronomy),
Wheat Improvement Project, College of Agriculture,
RVSKVV, Gwalior -474 002, MP.
Email: spstomar_agril@hotmail.com
3. Indore Dr KC Sharma, Senior Scientist (Agronomy),
IARI Regional Station, Old Sehore Road,
Indore- 452 001, MP.
Email: kc_64sharma@yahoo.com, Mobile: 07489893860
4. Jabalpur Dr RS Shukla, Principal Scientist &Incharge,
Wheat Improvement Project,Dept of Plant Breeding,
JNKVV, Jabalpur-482 004 (MP)
5. Junagarh* Dr VB Ramani, Assistant Research Scientist (Agronomy),
Wheat Research Station, JAU, Junagarh-362 001, Gujarat. *Email: vinod@jau.in, Mobile: 09428775044*
