## **FOREWORD**

---

The wheat production of the country has increased from 10.4 mt in 1965-66 to 98.4 mt during 2016-17. This increase in wheat production has been possible owing to the development of high-yielding varieties and matching production and protection technologies. Varietal development is one of the major components of the All India Coordinated Research Project on Wheat and Barley. A total of 448 wheat varieties have so far been notified for cultivation in different agro-ecological regions of the country. These varieties are instrumental in strengthening the food security of the country. There are product specific varieties for bread, biscuits, pasta etc or varieties tolerant to drought, late heat, micro-nutrient deficient soil, salinity, alkalinity, water logging and biotic stresses. The Genetic Resources Unit (GRU) of the ICAR-Indian Institute of Wheat and Barley Research, Karnal is managing the database of notified varieties besides trait specific genetic stocks of wheat and barley registered by the Plant Germplasm Registration Committee. The GRU of ICAR-IIWBR is also assigned the responsibility of multiplying and supplying seeds of notified varieties, registered genetic stocks, AVT lines and other important exotic and indigenous germplasm. The responsibility of filing applications for registration of wheat varieties under the Protection of Plant Varieties Act (PPV&FRA), 2001 is also been entrusted to the ICAR-IIWBR by the ICAR.

It is highly gratifying to note that the updated information on wheat varieties notified in India has been compiled by the GRU of IIWBR in the form of present book. All the varieties are categorized zone/state wise vis-a-vis production condition wise. Information on parentage, institute and breeders who developed the variety, yield and special features of each variety is also provided in this publication. I hope this publication would be very useful to researchers, extension workers, seed certification agencies and policy makers.

(GP Singh)  
Director  
ICAR-IIWBR

## PREFACE

---

The wheat varietal development programme in India is carried out under the aegis of the All India Coordinated Research Project on Wheat and Barley through funded and voluntary centres located in various agro-ecological regions of the country. A total of 448 wheat varieties have been notified by the Central Sub-Committee on Crop Standards, Notification and Release of Varieties for Agricultural Crops (CVRC) since 1965. The varieties released by the CVRC were categorised as 'central variety', similarly wheat varieties released by State Varietal Release Committee (SVRC) of respective states were categorised as 'state variety'. Among the 448 varieties notified in India, 378 are bread wheat, 59 durum, 7 dicoccum and 4 triticale varieties.

The present publication provides up-to-date information on wheat varieties notified in India. Information compiled in this publication is mainly taken from the identification proposal or notification proposal submitted to the Director, ICAR-IIWBR or Department of Agriculture and Farmers' Welfare, Govt. of India. In case of old varieties (Varieties notified before 1965), where the identification/notification proposal were not available, the information were taken from "An update on released wheat varieties and registered genetic stocks (*Triticum spp.*)" published by the ICAR-Indian Institute of Wheat and Barley Research (erstwhile Directorate of Wheat Research) published in 2011 and various published sources and web sites of the universities/institutes or from the scientists at different centers of the All India Coordinated Research Project on Wheat and Barley. The listed varieties have been categorised production condition wise along with information about their pedigree, developing institute/university and name's of breeders responsible for the development of variety, notification number and date of release, average yield, potential yield and special features. The researchers, farmers and policy-makers can select the wheat varieties as per their need.

We hope that this book would be useful to researchers, academicians, students, extension workers, farmers and seed producers in various ways.

X

Wheat breeding in India was first initiated in a systematic way at the Imperial Agricultural Research Institute, Pusa, Bihar in 1905. The emphasis during earlier days was given to varietal development through pureline selection in indigenous material. This led to the development of wheat varieties Pusa4, Pusa6 and Pusa12, which were further used in hybridization programme. Later, wheat improvement work was initiated at Lyallpur, Kanpur, Sabour, Powarkheda, Niphad and Pune resulting in many outstanding wheat varieties like PbC518, PbC591, C273, C281 and C286. In 1935, work on resistance breeding was initiated which resulted in the development of rust resistant varieties like NP783 and NP784 (resistant to brown rust); NP785 and NP786 (resistant to all races of yellow rust); NP789 and NP790 (resistant to black rust). Later NP809 resistant to all the three rusts and loose smut was developed by Dr BP Pal and Dr KC Mehta.

Yield enhancement has been the main aim of wheat breeding in India. However, quality (consumer preference/ grain characteristics) components were also given due emphasis in varietal development. C306, a tall variety developed by CCSHAU, Hisar for rainfed cultivation in NWPZ during early sixties is still preferred by consumers because of its chapatti quality and other traits. The varietal development programme got an impetus with the establishment of the All India Coordinated Wheat Improvement Project (AICWIP) at IARI, New Delhi in 1965. It was just a matter of coincidence that the introduction of semi-dwarf genotypes from Mexico and the establishment of AICWIP took place simultaneously. The massive hybridization work involving dwarf wheat genotypes led to the development of many high yielding and disease resistant wheat varieties in India which ushered in the green revolution in India. The massive success of the green revolution in wheat paved the way for genetic improvement in other food crops too. The green revolution is considered one of the biggest technological achievements of the 20<sup>th</sup> century. This can be witnessed from the fact that the area, production and productivity of wheat has increased by about 143%, 846% and 289%, respectively in the year 2016-17 over the base year 1965-66. The great success of the AICWIP was possible through the development of large number of high yielding varieties of wheat suited to meet the agronomic needs of various agro-ecological wheat growing zones in the country.

**Table 1.1: Area, production and productivity of wheat during 1965-66 and 2016-17**

Year	Area (m ha)	Production (mt)	Productivity (kg/ha)
2016-17	30.60	98.40	3216
1965-66	12.57	10.40	827

The wheat cultivated area in India has now peaked at around 30 million hectares. The major wheat cultivated areas fall in the plains areas (~29mha) of Gangetic Plains of northern and the central and peninsular parts which are further divided into four major agro-ecologic mega-zones viz. North Western Plains Zone (NWPZ), North Eastern

Plains Zone (NEPZ), Central Zone (CZ), Peninsular Zone (PZ). The hills area is around one million hectares and it constitutes the Northern Hills Zone (NHZ) (Table 1.2). The Southern Hill zone comprising Nilgiri and Palni hills was a separate zone till 2014-15, however the foot hills part of Nilgiri where wheat was mainly cultivated was merged with PZ from 2015-16 onwards. The SHZ ceased as a separate zone 2017-18. Each zone has its unique features and agroecological parameters.

**Table 1.2: Wheat growing mega-zones in India**

Zone	Area
North Western Plains Zone (NWPZ)	Punjab, Haryana, Delhi, Rajasthan (except Kota and Udaipur divisions) and Western UP (except Jhansi division), parts of J&K (Jammu and Kathua distt.) and parts of HP (Una distt. and Paonta valley) and Uttarakhand (Tarai region)
North Eastern Plains Zone (NEPZ)	Eastern UP, Bihar, Jharkhand, Odisha, West Bengal and plains of Assam
Central Zone (CZ)	Madhya Pradesh, Chhattisgarh, Gujarat, Rajasthan (Kota and Udaipur divisions) and Uttar Pradesh (Jhansi division)
Peninsular Zone (PZ)	Maharashtra and Karnataka
Northern Hills Zone (NHZ)	Western Himalayan regions of J&K (except Jammu and Kathua distt.); Himachal Pradesh (except Una and Paonta Valley); Uttarakhand (except Tarai area); Sikkim and hills of West Bengal and N.E. States

The wheat crop is cultivated primarily under three broad cultural conditions, viz timely sown irrigated, late sown irrigated and timely sown restricted irrigation, whereas in NHZ, the major area under wheat is rainfed (83%) and irrigated area is confined only to valleys. All the three wheat species are cultivated in India. Bread wheat (*Triticum aestivum*) is grown in more than 96% of the total wheat area, while durum (*T. durum*) and dicoccum (*T. dicoccum*) wheat occupy around 4% area. The bread wheat is grown throughout the zones, while durum wheat is mainly grown in CZ and PZ and dicoccum wheat is confined to PZ.

To cater the need of each agro-climatic condition and cultural conditions, around 294 varieties of wheat have been released and notified by the Central Sub-Committee on Crop Standards, Notification and Release of Varieties for Agricultural Crops (CVRC). Similarly, around 154 wheat varieties released by the State Varietal Release Committee (SVRC) were notified under section 5 of Seeds Act, 1966. So far, 378 bread wheat varieties, 59 durum wheat and 7 dicoccum wheat beside 4 triticale varieties have been notified (Table 1.3).

The present publication is aimed to provide an updated list and features of the notified wheat varieties in India.

**Table 1.3: Breakup of notified varieties of wheat (upto June, 2018)**

Crop species	CVRC	SVRC	Total
Bread wheat ( <i>T. aestivum</i> )	246	132	378
Durum ( <i>T. durum</i> )	37	22	59
Dicoccum	6	1	7
Triticale	4	-	4
Total	293	155	448

There are 11 varieties namely C306, Sonora 64, UP 2382, GW 322, DDK 1029, HD 2278, HD 2380, HD 2932 and HD 2967 which were notified for more than one zone/state.

The development of wheat varieties in India is undertaken primarily through the auspices of a well-knitted public funded programme under the All India Coordinated Research Project on Wheat and Barley. This coordinated research programme is undertaken through the cooperation of funded and voluntary research centres engaged in the development and testing of new genotypes of wheat. The ICAR-Indian Institute of Wheat and Barley Research Institute located at Karnal (Haryana) is the nodal centre for wheat research in India and is bestowed to function as the coordinating unit for organising multi-location research and evaluation/testing schedules for new genotypes of wheat. Wheat is cultivated in India under irrigated, restricted irrigation and rainfed cultural conditions (Table 2.1). As wheat is grown in a cropping system mode, the time of sowing of Wheat is always dependent on the maturity duration of the kharif crops. Thus, there is a late sown crop of wheat besides the normal or timely sown crop which is generally sown during November. The varietal development programme in wheat is thus carried out to meet the crop's cultural conditions, *viz.*, timely sown irrigated, late sown irrigated condition and timely sown restricted irrigation. The rainfed condition is mainly confined to the hill terraces/slopes and valleys of the NHZ.

The evaluation of new genotypes developed at different wheat breeding centres in the country is organised for a period of three years with one year of pre-evaluation for disease reaction of the genotypes in a multi-location Initial Plant Pathological Screening Nursery (IPPSN) which is carried out at hot-spot locations for different diseases. On the basis of disease response, entries are invited from the breeding centres for different coordinated trials. The varietal evaluation programme of three years is split into two types of trials *viz.*, National Initial Varietal Trial (NIVT) which is carried out for one year with small plot size (6 rows of 6m length) and it is followed by two years of evaluation in Advance Varietal Trial (AVT) conducted in double the plot area of NIVT(12 rows of 6m length). NIVTs for different cultural conditions are constituted *viz.*, NIVT1A and NIVT1B for irrigated timely sown condition in NWPZ and NEPZ; NIVT2 for irrigated timely sown condition in CZ and PZ, NIVT3A for late sown irrigated condition in NWPZ and NEPZ, NIVT3B for irrigated late sown conditions in PZ and CZ; NIVT4 for durum under irrigated timely sown condition in CZ and PZ; NIVT5A for timely sown restricted irrigated condition in all plains zones and NIVT5B for durum under restricted irrigated timely sown condition in CZ and PZ. In the hills, Initial Varietal Trial (IVT) is laid out under rainfed and irrigated conditions in NHZ. In NHZ, trials are also constituted for early sown rainfed condition and late sown restricted irrigated condition. The NIVTs are conducted in two or more zones and laid out at main centres, while the AVTs for each series of trial are constituted at zonal level comprising genotypes promoted from NIVT or IVT and these are laid out at large number of centres spread across the concerned zones.

The genotypes promoted to Advance Varietal Trials (AVT) from NIVT are tested for two

Northern Hills Zone (NHZ)	CSK-HPKV-Palampur, CSK-HPKV-Bajaura SKUAST- Srinagar CAU- Imphal	Akrot, Almora, Bara, Berthin, Dhaulukan, Gangtok, Kalimpong, Majhera, Ranichauri, Shimla, Una, Wadura

years i.e., AVT-I and AVT-II. Only the superior genotypes from AVT-I are promoted to AVT-II. The restricted irrigation NIVTs have been recently modified to comprise NIVT 5A having bread wheat genotypes for NWPZ and NEPZ and NIVT 5B having both bread wheat and durum genotypes for CZ and PZ. During the whole testing period, the genotypes are screened for their response to various wheat diseases, particularly rusts which are the most damaging fungal pathogens affecting the yield in wheat. There are set norms based on yield and reaction to various diseases which guide the promotion of genotypes to next level of yield evaluation trials. The quality traits of genotypes are also evaluated during all the years of testing. The agronomic performance of the genotypes under the required cultural condition of the evaluation of the genotypes is evaluated in the final year of trial (AVT-II). This helps to specify the package of practices for each genotype under testing.

Special trials have been formulated to meet the requirements of specific situations eg., salinity/alkalinity, dicoccum, triticale, marker aided backcross breeding and bio-fortification. There is a well-defined protocol for evaluation of entries in these special trials under the required cultural conditions.

All the genotypes which complete three years of multi-location evaluation and found good for yield, disease resistance, quality features and agronomic performance qualify for being considered for identification as new wheat varieties. Proposals for identification of new varieties are placed before the Varietal Identification Committee (VIC) meeting held during the Annual Wheat and Barley Research Workers' Meet which is organised every year. The varieties identified by the VIC are then proposed for release and notification by the Central Sub-Committee on Crop Standards, Notification and Release of Varieties for Agricultural Crops (CVRC). After approval by the CVRC, the varieties are notified in the gazette of India and this marks the beginning of the commercial seed production chain of the released varieties. Such varieties are categorized as 'Central released' variety. Central varieties generally have wider adaptability.

Many genotypes developed by the state agricultural universities do not perform well in the coordinated varietal yield evaluation trials, but they yield well at centres located in the particular state. Such varieties which perform well within a state are identified and proposed by the concerned State Varietal Release Committee (SVRC) to the CVRC for granting approval for notification in the state. The SVRC released varieties have to be tested at least for one year in the coordinated evaluation system. Such varieties are categorized as 'State released' variety. State varieties are adapted for niche area in the state.

Around 294 central released and 154 state released wheat varieties which have so far been notified under the Seed Act, 1966 are documented in this publication. The zone-wise details of central released varieties and state wise details of state released varieties are given in the publication.

## **2.1 Zone Wise Varieties Released and Notified by the CVRC**

### **2.1.1 Wheat Varieties Released for all the zone**

Four wheat varieties namely Kalyansona, Sharbati Sonora, Sonalika and Chotti Lerma were released for almost all the zone way back in 1969.

#### **Wheat Varieties developed for different production conditions of all the zones**

Irrigated timely sown conditions: 2

Irrigated late sown conditions: 2

### **2.1.2 Northern Hill Zone (NHZ)**

This region encompasses the hilly terrain of Northern region extending from Jammu & Kashmir to North Eastern States. The NHZ comprises J&K (except Jammu and Kathua distt.); Himachal Pradesh (except Una and Paonta Valley); Uttarakhand (except Tarai area); Sikkim, hills of West Bengal and North Eastern states.

The wheat grown in the NHZ generally has productivity of 15-16 q/ha. Moisture stress is the major factor responsible for low productivity besides soil fertility, soil depth, frost damage, small and fragmented holdings, low and imbalanced use of fertilizers. High incidence of weeds and diseases, particularly yellow rust, brown rust and loose smut etc. are the other factors that limit the productivity. Wheat is cultivated in the hills at different altitude under different crop rotation adapted at different elevations. In NHZ, sowing is generally done under rainfed conditions in October/November with residual moisture and harvesting takes place in May/June. In higher hills of Leh (J&K) and Lahaul and Spiti (H.P.), the winter is severe, causing the crop to be raised between May to September.

Development of high yielding varieties for moisture stress condition is the major objective of wheat improvement programmes in NHZ. State Agricultural universities namely SKUAS&T, Kashmir, CSK HPKV, Palampur and its regional research station located in Malan and Bajaura, GBPUA&T, Pantnagar and ICAR institutes namely ICAR-IARI Regional Station, Shimla and ICAR-VPKAS, Almora are working for development of high yielding varieties for NHZ. These centres have evolved a good number of high yielding rust resistant varieties; among which VL 616, HS 240, HPW 251 and recently released varieties, HS 507, VL 907, VL 892, HPW 349 are quite popular among the farmers of this region. A total of thirty-six wheat varieties have been notified for this region. The details of varieties along with production conditions have been given in table 2.1.2 to 2.1.7.

#### **Wheat Varieties developed for different production conditions of NHZ**

Rainfed, early sown : 5

Rainfed, timely sown conditions : 3

Rainfed/ irrigated, timely sown conditions : 18

Restricted irrigation, late sown conditions : 6

Rainfed, timely sown conditions : 4

### **2.1.3 North Western Plains Zone (NWPZ)**

North Western Plains Zone comprises Punjab, Haryana, Delhi, Rajasthan (except Kota and Udaipur Divisions), Western Uttar Pradesh (except Jhansi Division), Jammu and Kathua districts of Jammu and Kashmir, Una district and Paonta valley of Himachal Pradesh and Terai region of Uttarakhand. This zone has the largest (~12m ha) area in the country and contributes about 55% of the total wheat production in the country.

With assured irrigation facility available in ~95% area, wheat is mainly cultivated under high fertilizer dose in this zone. Major part of this zone caters to irrigated, timely sown conditions (mainly rice- wheat rotation) followed by the irrigated, late sown (cotton-wheat in Punjab and Haryana or sugarcane-wheat in western U.P.). The intensive tillage and excessive use of fertilizer and water resources are increasing the cost of cultivation on one hand and causing quicker depletion of organic carbon in the soil on the other hand. Thus, resource conservation technology are becoming the need of the hour. Reduced or zero tillage are becoming popular in North Western Plains of India.

Yellow rust, terminal heat stress during grain filling stage and decline of water table are the major constraints in wheat production. Development of high yield potential, disease resistant and climate resilient varieties are the major objectives of the wheat improvement programmes in NWPZ. Various pioneer research institutes/ Agricultural universities located in this zone such as IARI New Delhi; PAU Ludhiana, CCSHAU Hisar, GBUA&T Pantnagar and SKNA University Regional Station Durgapura played a significant role in the development of wheat varieties for increasing the production and productivity of this zone. Various varieties such as HD 2009, HD 2285, HD 2329, PBW 343, DBW 17, HD 2967 and HD 3086 occupied large areas and had farmers' preference as landmark varieties of this zone. These varieties were instrumental in enhancing the productivity of this zone. Of late, the ICAR-IIWBR has also developed high yielding wheat varieties for NWPZ. Out of 80 wheat varieties notified for NWPZ, around 45% are for irrigated timely sown conditions. The production condition wise varieties are listed in Table 2.1.7 to 2.1.12.

#### **Wheat varieties developed for different production conditions of NWPZ**

Irrigated, timely sown conditions: 36

Irrigated, late sown conditions: 18

Irrigated, timely sown as well as late sown: 3

Rainfed, timely sown conditions: 11

Restricted irrigation, timely sown conditions: 2

Durum and triticale varieties: 10

## **2.1.4 North Eastern Plains Zone (NEPZ)**

The North Eastern Plains Zone comprises eastern Uttar Pradesh, Bihar, Jharkhand, Assam, West Bengal plains. In the NEPZ, wheat is cultivated under highly diverse situations in around 8 million ha area. Among different wheat growing zones, this zone occupies 27% of total wheat area and accounts for 22% of the total wheat production in the country. The average productivity in the NEPZ hovers around 20-21q//ha which is far lower than the national productivity of 30 q/ha registering a yield gap of around 30-35%.

Rice-wheat system is the most common cropping pattern followed in this zone. In Bihar, the rice-wheat, maize-wheat and pulse- wheat cropping patterns are followed, whereas rice- wheat and potato-wheat cropping patterns occupy most of the wheat growing areas in Bengal.

The crop faces harsh environment like high temperature at the time of crop growth and grain filling, moisture stress due to lack of proper irrigation facilities, micro-element deficiencies and toxicities in soil, water-logged situation due to excess rains in some parts. Diseases like spot blotch and brown rust are the most important ones. Development of multiple stress resilient genotypes is the major goal of wheat improvement programmes for NEPZ. Various research institute/ universities such as CSAU&T, Kanpur, NDUA&T, Faizabad, BHU-Varanasi located in this zone have developed many high yielding varieties suitable for cultivation in this zone. At one point of time, wheat varieties such as UP 262 and HUW 234 were quite popular among the farmers of this zone due to their wider adaptability and input responsiveness. Recently released varieties such as HD 2967, DBW 14, DBW 39, CBW 38, K 0307, K 1006, HD 2733, NW 5054 occupy sizeable area in the zone. A total of 55 wheat varieties have been notified for different production conditions of NEPZ (Tables 2.1.13 to 2.1.18).

### **Wheat Varieties developed for different production conditions of NEPZ**

Irrigated, timely sown conditions: 29

Irrigated, late sown conditions: 14

Irrigated, timely sown as well as late sown: 2

Rainfed, timely sown conditions: 6

Rainfed, late sown conditions: 3

Restricted irrigation, timely sown: 1

High levels of field resistance to yellow and brown rust.

## **2.1.5 Central Zone (CZ)**

The Central Zone comprises Madhya Pradesh, Chhattisgarh, Gujarat, Rajasthan (Kota and Udaipur divisions) and Jhansi division of Uttar Pradesh. This zone is known for premium quality bread wheat having typically hard lusterous grains with high gluten strength. This zone is also having sizeable area under durum wheat.

The zone is characterized by black cotton soil classified as vertisols. The vertisols pose problems when too dry or too wet resulting in formation of cloddy or puddle structure, respectively (Krantz et al. 1978). The vertisols have high water retention capacity producing high yield under limited water availability also. Soybean-wheat has emerged as most prevalent cropping system after 1980. Constraints of irrigation water availability and high temperature allthrough the crop cycle limit the exploitation of yield potential. Development of water use efficient high yielding varieties having tolerance to early and late heat and product specific varieties are the major objectives in both bread and durum wheat improvement programme in CZ.

There is need to focus research on new emerging issues like change in the dynamics of diseases and pests under changing climatic condition as well as improvement in quality traits. IARI RS Indore, JNKVV RS Powarkheda, SDAU Vijapur, JAU Junagadh, JNKVV Jabalpur are the major research centres working on development of high yielding varieties in CZ. Lok 1 wheat variety, developed by Lokbharti Gramvidyapith, Sanosara, Gujarat was the most preferred wheat variety by the farmers of this zone till 2005. Varieties such as Jairaj, Sujata (HI 617), Swati (HI 787), HI 8498, MP 4010, GW 273, GW 322, GW 366 and HI1544 have made impact in increasing the production and productivity of this zone. A total of 38 bread wheat varieties and 18 durum and dicoccum wheat varieties have been notified for different production conditions of CZ (Tables 2.1.19 to 2.1.25)

### **Wheat Varieties developed for different production conditions of CZ**

Irrigated, timely sown conditions: 12

Irrigated, late sown conditions: 10

Irrigated, timely sown as well as late sown conditions: 2

Rainfed, timely sown conditions: 6

Rainfed/Restricted irrigation, timely sown conditions: 4

Restricted irrigation, timely sown conditions: 4

Durum and dicoccum varieties for irrigated, timely sown conditions: 12

Durum and dicoccum varieties for rainfed, restricted irrigation, timely sown conditions: 6

## **2.1.6 Peninsular Zone (PZ)**

Peninsular Zone primarily comprises Maharashtra and Karnataka. All the three species of wheat viz *aestivum*, *durum*, and *dicoccum* are cultivated in this zone. Bread wheat cultivation is concentrated under irrigated environments, whereas, the cultivation of durum and dicoccum wheat is generally confined to rainfed/ restricted irrigation situation. In this zone, optimum ambient cool temperature for cultivation exists for a very short period causing the wheat to mature in around 90-100 days as compared to 140-150 days in the NWPZ.

Sorghum-wheat is one of the most prevalent cropping systems in western Marathwada and Vidarbha regions of Maharashtra and northern parts of Karnataka. Maize-wheat and sunflower-wheat cropping sequence are being practiced in some parts of Karnataka. Sugarcane-wheat cropping system is also gaining importance in Ahmednagar and Kolhapur districts of Maharashtra and Belgaum district of Karnataka.

High temperature all through the crop cycle, light soils, imbalanced use of organic and inorganic fertilizers, lack of sufficient irrigation are the major reasons for low productivity (15-16q/ha). To increase the production and productivity of wheat in PZ, MPKV Research station Niphad, UAS Dharwad and Agharkar Research Institute Pune are having strong breeding programmes and have developed many popular wheat varieties. Bread wheat cultivation in peninsular zone was revolutionized with the release of variety DWR-162 developed at Dharwad centre in 1993. Varieties HD 2189, NI 5439, NIAW 917 and MACS 6222 are the some of popular varieties of this zone. The condition wise varieties alongwith details are given in table 2.1.27 to 2.1.35.

### **Wheat Varieties developed for different production conditions of PZ**

- Irrigated, timely sown conditions: 16
- Irrigated, late sown conditions: 10
- Rainfed/irrigated, timely sown as well as late sown conditions: 1
- Rainfed, timely sown conditions: 5
- Restricted irrigation, timely sown conditions: 3
- Rainfed/irrigated, timely sown conditions: 2
- Rainfed/restricted irrigation, timely sown conditions: 3
- Durum varieties for Irrigated, timely sown conditions: 12
- Durum varieties for rainfed, timely sown conditions: 5

### **2.1.7 Southern Hills (Nilgiri and Palni Hills)**

The SHZ comprises hilly areas of Tamil Nadu and Kerala falling in the Nilgiri and Palni hills of southern plateau. The area under wheat cultivation has significantly reduced over the years due to preference for tea and vegetable cultivation by producers. Moisture stress and acidic soils are the major constraints in wheat production. IARI regional station Wellington, Tamilnadu located in this zone is instrumental with the development of improved disease resistance varieties, screening of materials for disease resistance and advancement of generations. The first *dicoccum* wheat in India named as NP 200 was developed by this centre. Nine wheat varieties have been released and notified for these areas are given in Table 2.36 - 2.38. This zone is merged with PZ from 2015-16 onwards. Since the present area under wheat cultivation in SHZ is too less to qualify for delineation as a separate zone, this zone has ceased to be classified as a separate zone for conduction of coordinated trials from 2017-18 season.

#### **Wheat Varieties developed for different production conditions of SHZ**

Restricted irrigation, timely sown conditions: 5

Rainfed/Restricted irrigation, timely sown conditions: 2

Dicoccum varieties restricted irrigation, timely sown conditions: 1

### **2.1.8 Salinity and Alkalinity affected soils**

The major states where wheat is cultivated under salinity and alkalinity affected soils are Uttar Pradesh, Rajasthan, Gujarat, Maharashtra and Haryana. The Central Soil Salinity Research Institute, Karnal is exclusively working on development of salt tolerant wheat varieties. A total of five salt tolerant varieties of wheat have been developed having yield potential of 43-48 q/ha (Table 2.1.39) under irrigated timely sown conditions.

**Table 2.1.36: Varieties notified for restricted irrigation, timely sown conditions of Nilgiri and Palni hills**

## 2.2

## State Varieties or State Released and Notified Wheat Varieties

---

Every state has its own state Seed Sub-Committee for the release of crop varieties. Central Sub-Committee constitutes the State Seed Sub-Committee for every state. The release of new variety for the state is one of the functions of SSSc. The research centres located in the states develop locally adapted Varieties in the state through organised varietal testing programmes which are generally coordinated by the state agricultural departments. For wheat, the SVRC released varieties have to be tested for one year in AICRPW&B trials for disease response screening of the recommended variety. For the release of state variety, SSSc rely on the data generated through All India Coordinated Trials for the particular state or they ask the breeders to generate data on separate set of trials at various location of the state. Once SSSc approve the release of variety, the notification proposal in the prescribed format has to be submitted for the consideration of Central Sub-committee on Crops Standards, Notification and Releases of varieties for consideration and notification. The CVRC recommends notification of varieties after verifying that the varietal evaluation trials were conducted properly. A total of 154 wheat varieties (131 in bread wheat, 22 in durum and 1 in dicoccum) have been notified for various states (Table 2.40 – 2.62).

The naming of variety is an important in varietal evaluation in AICRP-W&B. The names, generally abbreviated, are prefixed before a numbered series to identify the variety developing centre. There is well defined set of prefix (Appendix II), which are being used by the research centre while nominating entries for testing in coordinated trials. However at the time of notification, different or other common names are assigned to the entry by some of the breeders/Institute for popularizing the varieties. These names are considered as synonyms of variety. Sometimes, synonym causes confusion to farmers as well as to scientific community, whether the variety they are referring is same or different. In this chapter, name of the variety and other synonym name is presented.

Variety Name	Common Name	Variety Name	Common Name

## Appendix I

### Abbreviations used in text

APR	Adult Plant Resistance
AV.	Average Yield
CZ	Central Zone (Madhya Pradesh, Chhattisgarh, Gujarat, Bundelkhand regions of Uttar Pradesh, Kota and Udaipur divisions of Rajasthan)
CCN	Cereals Cyst Nematode
GUJ	Gujarat
HA	High Altitude
HP	Himachal Pradesh
IR	Irrigated
J & K	Jammu & Kashmir
KAR	Karnataka
KB	Karnal Bunt
LB	Leaf Blight
IR	Restricted Irrigation
LS	Late Sown
MAH	Maharashtra
MP	Madhya Pradesh
NEPZ	North Eastern Plains Zone (Eastern Uttar Pradesh, Bihar, Jharkhand, West Bengal, Orissa, Plains of Assom)
NHZ	Northern Hills Zone
NWPZ	North Western Plains Zone (Punjab, Haryana, Western Uttar Pradesh, Delhi, Una & Paontai Valley of Himachal Pradesh, Terai of Uttarakhand, Parts of Rajasthan Alwar, Bharatpur & Srigananagar)
PZ	Peninsular Zone (Maharashtra, Karnataka, Plains of Tamil Nadu Chennai and Andhra Pradesh)
POT.	Potential yield
RAJ	Rajasthan
RES	Resistant
RF	Rainfed
SEL	Selection
SHZ	Southern Hills Zone (Nilgiris&Palni Hills)
SPS	Species
SVRC	State Variety Release Committee
TGW	Thousand grain weight
TN	Tamil Nadu
TOL	Tolerance
TS	Timely Sown
UP	Uttar Pradesh
UT	Uttarakhand
VLS	Very late sown
WB	West Bengal

## Appendix II

### Prefix assigned to the varieties developed by different research institutes and their address

<b>Prefix</b>	<b>Centre name</b>	<b>Address</b>
AKDW	AKOLA	Crop Research Station, PDKV, Akola, Maharashtra
AAI, SHIATS	ALLAHABAD	Sam Higginbottom Institute of Agriculture, Technology and Sciences (erstwhile Allahabad Agricultural Institute), Allahabad, U.P.
VL	ALMORA	ICAR-Vivekanand Parvatiya Krishi Anusandhan Sansthan, Almora, Uttarakhand
A	ARNEJ	Anand Agricultural University, Regional Research Station, Arnej, Gujarat
HPW	BAJAURA	CSK-HPKV, Regional Station, Bajaura, Himachal Pradesh
HB	BHOWALI	ICAR-NBPGGR Regional Station, Bhowali, Uttarakhand
BIJA	BIJAPUR	UAS-College of Agriculture, Bijapur, Karnataka
CG	BILASPUR	IGKV-TCB College of Agriculture and Research Centre, Bilaspur, Chhattisgarh
BW	BURDWAN/MALDA	Deptt. of Agriculture, West Bengal, Burdwan; Department of Agriculture West Bengal, Malda
OW	CHIPLIMA	Orissa University of Agriculture & Technology, Regional Station, Chiplima, Odisha
UBW	COOCHBEHAR	UBKVV, Coochbehar, West Bengal
KRL	CSSRI	ICAR-Central Soil Salinity Research Institute, Karnal, Haryana
UAS, DDK, DWR	DHARWAD	University of Agricultural Sciences, Dharwad, Karnataka
RAJ	DURGAPURA	SKNA University, Rajasthan Agricultural Research Institute, Durgapura, Rajasthan
CBW, CPAN, DBW, DDW, WB,	IIWBR, KARNAL	ICAR-Indian Institute of Wheat and Barley Research (erstwhile Directorate of Wheat Research), Karnal, Haryana
NW	FAIZABAD	ND University of Agriculture & Technology, Faizabad, U.P.
GW	GUJARAT	Wheat Research Station, S D Agricultural University, Gujarat
WG	GURDASPUR	Punjab Agricultural University, Regional Station, Gurdaspur, Punjab
RVW	GWALIOR	RVSKVV, Gwalior, M.P.
WH, WHD	HISAR	CCS Haryana Agricultural University, Hisar, Haryana
HI	INDORE	ICAR-IARI Regional Station, Indore, M.P.
MP, JW	JABALPUR	JNKVV, Jabalpur, M.P.
JAUW, RSP	JAMMU	SKUAS&T, Jammu, J&K

GW	JUNAGARH	Junagadh Agricultural University, Junagarh, Gujarat
RKW	KOTA	MPUA&T, Kota, Rajasthan,
K, KD	KANPUR	CSA University of Agriculture & Technology, Kanpur, U.P.
PBW, PDW, WL, TL	LUDHIANA	Punjab Agricultural University, Ludhiana, Punjab
NP, HD	N DELHI	ICAR-Indian Agricultural Research Institute, New Delhi
NIAW, NIDW	NIPHAD	MPKV, Regional Station, Niphad, Maharashtra
HPW	PALAMPUR	CSK-HPKV, Palampur, H.P.
UP, UPD	PANTNAGAR	GB Pant University of Agriculture & Technology, Pantnagar, Uttarakhand
PBN, PBND	PARBHANI	Marathwada Krishi Vidyapeeth, Parbhani, Maharashtra
BR	PATNA & SABOUR	Rajendra Agricultural University, Regional Station, Patna, Bihar Agriculture College, Sabour, Bhagalpur, Bihar
MP, MPO	POWARKHEDA	JNKVV Regional Station, Powarkheda, M.P.
MACS	PUNE	Agharkar Research Institute, Pune, Maharashtra
HP	PUSA	ICAR-IARI Regional Station, Pusa, Bihar
JKW	RANCHI	BAU, Ranchi, Jharkhand
BRW	SABOUR	BAU, Sabour, Bhagalpur, Bihar
JWS	SAGAR	JNKVV Regional Station, Sagar, M.P.
LOK	SANOSARA	Lok Bharti, Sanosara, Gujarat
HS	SHIMLA	ICAR-IARI Regional Station, Shimla, H.P.
SKW	SRI NAGAR	SKUAS&T, Srinagar, J&K
HUW	VARANASI	Banaras Hindu University, Varanasi, U.P.
GW	VIJAPUR	Gujarat Agricultural University, Regional Station, Vijapur, Gujarat
PDKV WSM	WASHIM	PDKV Agriculture Research Station, Washim, Maharashtra
HW	WELLINGTON	IARI Regional Station, Wellington, Tamilnadu
